Preface

This document has been developed with the Technical Secretariat of the Batteries Pilot during the Commission PEF Project. This last edition I of the document corresponds to an extension of the date of validity of 1 year until 31 Dec 2021, without any other modification of the document.

25

Authors	Company name	Sector
Clémence Siret	Saft	Battery manufacturer
Jan Tytgat	Umicore	Material producer and battery recycler
Thomas Ebert	Apple	OEM manufacturer
Mark Mistry	Nickel Institute	Metals producer
Colin Thirlaway	Stanley Black & Decker	OEM manufacturer
Bertrand Schutz	Eramet	Material producer and battery recycler
Demosthene Xhantopoulos	Eramet	Material producer and battery recycler
Jean-Pol Wiaux	Recharge	Battery manufacturer
Claude Chanson	Recharge	Battery manufacturer
Willy Tomboy	Recharge	Battery manufacturer
Carol Pettit	Cobalt Institute	Metals producer
Johannes Gediga	Thinkstep	LCA Specialist
Marta Bonell	Thinkstep	LCA Specialist
Viviana Carrillo	Thinkstep	LCA Specialist

227	**VOC**	Volatile Organic Compound
228	**Wh**	Watt-hour

229

IV.   Definitions

231

For all terms used in this Guidance and not defined below, please refer to the most updated version of the Product Environmental Footprint (PEF) Guide, ISO 14025:2006, ISO 14040-44:2006, and the ENVIFOOD Protocol.

Activity data - This term refers to information which is associated with processes while modelling Life Cycle Inventories (LCI). In the PEF Guide it is also called "non-elementary flows". The aggregated LCI results of the process chains that represent the activities of a process, are each multiplied by the corresponding activity data[1] and then combined to derive the environmental footprint associated with a process (See Figure 1). Examples of activity data include quantity of kilowatt-hours of electricity used, quantity of fuel used, output of a process (e.g. waste), number of hours equipment is operated, distance travelled, floor area of a building, etc. In the context of PEF the amounts of ingredients from the bill of material (BOM) shall always be considered as activity data.

Active materials: Battery material directly linked to the electrochemical performance: includes the Cathode, Anode, Electrolyte and Separator.

Aggregated dataset - This term is defined as a life cycle inventory of multiple unit processes (e.g. material or energy production) or life cycle stages (cradle-to-gate), but for which the inputs and outputs are provided only at the aggregated level. Aggregated datasets are also called "LCI results", "cumulative inventory" or "System processes" datasets. The aggregated dataset can have been aggregated horizontally and/or vertically. Depending on the specific situation and modelling choices a "unit process" dataset can also be aggregated. See Figure 1[2].

Allocation: An approach to solving multi-functionality problems. It refers to partitioning the input or output flows of a process, a product system or a facility between the system under study and one or more other systems" (based on ISO 14040:2006).

Application specific - it refers to the generic aspect of the specific application in which a material is used. For example, the average recycling rate of PET in bottles.

Benchmark – A standard or point of reference against which any comparison can be made. In the context of PEF, the term 'benchmark' refers to the _average_ environmental performance of the representative product sold in the EU market. A benchmark may eventually be used, if appropriate, in the context of communicating environmental performance of a product belonging to the same category.

---

[1] Based on GHG protocol scope 3 definition from the Corporate Accounting and Reporting Standard (World resources institute, 2004).

[2] Source: UNEP/SETAC "Global Guidance Principles for LCA Databases"

260 **Bill of materials** – A bill of materials or product structure (sometimes bill of material, BOM or associated
261 list) is a list of the raw materials, sub-assemblies, intermediate assemblies, sub-components, parts and the
262 quantities of each needed to manufacture an end product.
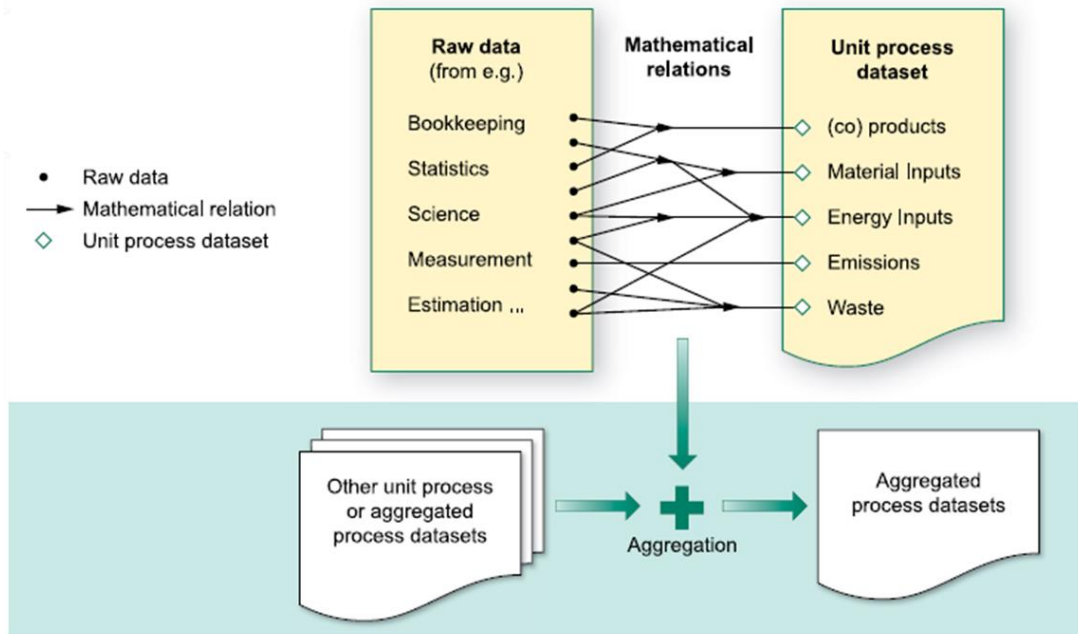

263
264 Figure 1: Definition of a unit process dataset and an aggregated process dataset

265

266 **Business to Business (B2B)** – Describes transactions between businesses, such as between a manufacturer
267 and a wholesaler, or between a wholesaler and a retailer.

268 **Business to Consumers (B2C)** – Describes transactions between business and consumers, such as between
269 retailers and consumers. According to ISO 14025:2006, a consumer is defined as "an individual member of
270 the general public purchasing or using goods, property or services for private purposes".

271 **Close loop & open loop**: A closed-loop allocation procedure applies to closed-loop product systems. It also
272 applies to open-loop product systems where no changes occur in the inherent properties of the recycled
273 material. In such cases, the need for allocation is avoided since the use of secondary material displaces the
274 use of virgin (primary) materials. An open-loop allocation procedure applies to open-loop product systems
275 where the material is recycled into other product systems and the material undergoes a change to its
276 inherent properties. [based on ISO 14044:2006]

277 **Cradle to grave**: A product's life cycle that includes raw material extraction, processing, distribution,
278 storage, use, and disposal or recycling stages. All relevant inputs and outputs are considered for all of the
279 stages of the life cycle.

280 **Cradle to gate**: A partial product supply chain, from the extraction of raw materials (cradle) up to the
281 manufacturer's "gate". The distribution, storage, use stage and end-of-life stages of the supply chain are
282 omitted.

283 **Commissioner of the EF study** - Organisation (or group of organisations) that finances the EF study in
284 accordance with the EF Guide, EF Guidance and the relevant PEFCR, if available (definition adapted from
285 ISO 14071/2014, point 3.4).

286 **Company-specific data** – it refers to directly measured or collected data representative of activities at a
287 specific facility or set of facilities. It is synonymous to "primary data".

288 **Comparative assertion** – environmental claim regarding the superiority or equivalence of one product
289 versus a competing product that performs the same function (adapted from ISO 14025:2006).

290 **Comparison** – A comparison, not including a comparative assertion, (graphic or otherwise) of two or more
291 products based on the results of a PEF study and supporting PEFCRs or the comparison of one or more
292 products against the benchmark, based on the results of a PEF study and supporting PEFCRs.

293 **Data Quality Rating (DQR)** - Semi-quantitative assessment of the quality criteria of a dataset based on
294 Technological representativeness, Geographical representativeness, Time-related representativeness, and
295 Precision. The data quality shall be considered as the quality of the dataset as documented.

296 **Direct elementary flows -** All emissions and resource use (also named elementary flows) that arise directly
297 in the context of a process. Examples are emissions from a chemical process, or fugitive emissions from a
298 boiler directly onsite. See Figure 2.

299 **Disaggregation -** The process that breaks down an aggregated dataset into smaller unit process datasets
300 (horizontal or vertical). The disaggregation can help making data more specific. The process of
301 disaggregation should never compromise or threat to compromise the quality and consistency of the
302 original aggregated dataset

303 **EF communication vehicles -** It includes all the possible ways that can be used to communicate the results
304 of the EF study to the stakeholders. The list of EF communication vehicles includes, but it is not limited to,
305 label, environmental product declarations, green claims, website, infographics, etc.

306 **EF report -** Document that summarises the results of the EF study. For the EF report the template provided
307 as annex to the PECFR Guidance shall be used. In case the commissioner of the EF study decides to
308 communicate the results of the EF study (independently from the communication vehicle used), the EF
309 report shall be made available for free through the commissioner's website. The EF report shall not contain
310 any information that is considered as confidential by the commissioner, however the confidential
311 information shall be provided to the verifier(s).

312 **EF study -** Term used to identify the totality of actions needed to calculate the EF results. It includes the
313 modelisation, the data collection, and the analysis of the results.

314 **Electricity tracking[3] -** Electricity tracking is the process of assigning electricity generation attributes to
315 electricity consumption.

316 **Elementary flow** - Material or energy entering the system being studied that has been drawn from the
317 environment without previous human transformation, or material or energy leaving the system being
318 studied that is released into the environment without subsequent human transformation.

319 **Energy (battery)**: electric energy which a battery delivers under specified conditions
320 Note: The SI unit for energy is joule (1 J = 1 W · s), but in practice, battery energy is usually expressed in
321 watthours (Wh) (1 Wh = 3 600 J) or kilo-watthours (1 kWh= 1000 Wh).

322 **Environmental aspect** – element of an organization's activities or products or services that interacts or can
323 interact with the environment (ISO 14001:2015)

324 **External Communication -** Communication to any interested party other than the commissioner or the
325 practitioner of the study.

326 **Foreground elementary flows -** Direct elementary flows (emissions and resources) for which access to
327 primary data (or company-specific information) is available.

328 **Functional Unit**: quantified performance of a product system for use as a reference unit. [based on ISO
329 14044:2006]

330 **Independent external expert -** Competent person, not employed in a full-time or part-time role by the
331 commissioner of the EF study or the practitioner of the EF study, and not involved in defining the scope or
332 conducting the EF study (adapted from ISO 14071/2014, point 3.2).

333 **Input flows** – product, material or energy flow that enters a unit process. Products and materials include
334 raw materials, intermediate products and co-products (ISO 14040:2006).

335 **Intermediate product** - an intermediate product is a product that requires further processing before it is
336 saleable to the final consumer.

337 **Lead verifier -** Verifier taking part in a verification team with additional responsibilities compared to the
338 other verifiers in the team.

339 **Life cycle**: Consecutive and interlinked stages of a product system, from raw material acquisition or
340 generation from natural resources to final disposal [based on ISO 14040:2006].

341 **Life Cycle Inventory (LCI)** - The combined set of exchanges of elementary, waste and product flows in an
342 LCI dataset.

3

https://ec.europa.eu/energy/intelligent/projects/en/projects/e-track-ii

343   **Life Cycle Inventory (LCI) dataset** - A document or file with life cycle information of a specified product or
344   other reference (e.g., site, process), covering descriptive metadata and quantitative life cycle inventory. A
345   LCI dataset could be a unit process dataset, partially aggregated or an aggregated dataset.

346   **Material-specific -** it refers to a generic aspect of a material. For example, the recycling rate of PET.

347   **Output flows** – product, material or energy flow that leaves a unit process. Products and materials include
348   raw materials, intermediate products, co-products and releases (ISO 14040:2006).

349   **Partially disaggregated dataset** - A dataset with an LCI that contains elementary flows and activity data,
350   and that only in combination with the complementing aggregated datasets that represent the activities
351   yields a complete aggregated LCI data set. We refer to a partially disaggregated dataset at level 1 in case
352   the LCI contains elementary flows and activity data, while at least some of the complementing sub-
353   processes are in their aggregated form (see an example in Figure 2). The underlying sub-processes should
354   be based on EF-compliant secondary datasets (if available).
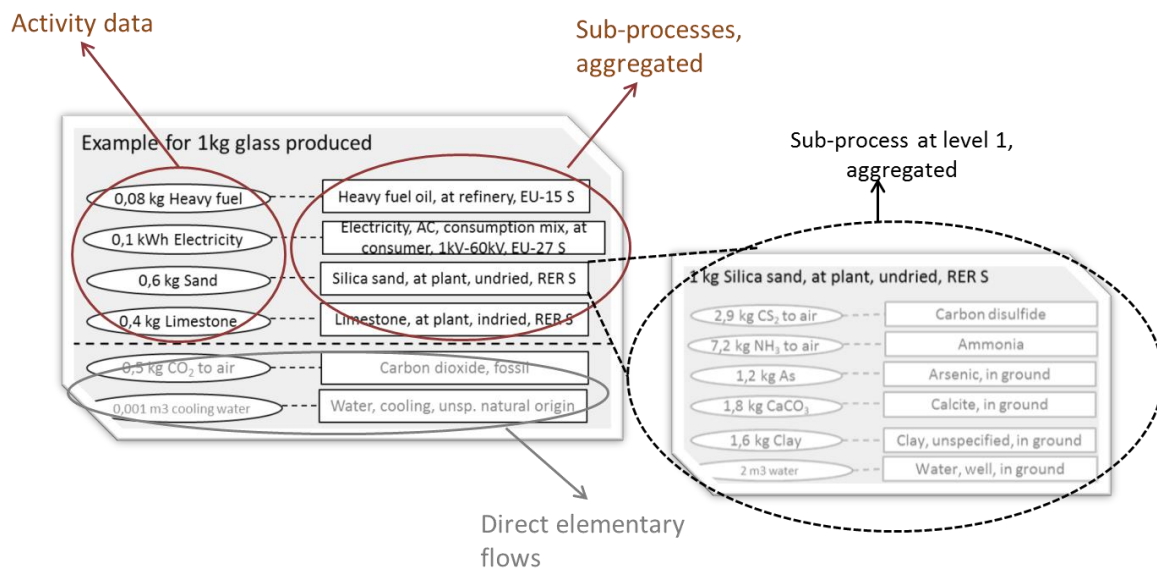

355

356   **Figure 2: An example of a partially aggregated dataset, at level 1.**

357   The activity data and direct elementary flows are to the left, and the complementing sub-processes in their
358   aggregated form are to the right. The grey text indicates elementary flows

359   **Passive materials:** Battery materials not directly producing the electrochemical performance: cell casing,
360   battery casing and OEM parts**.**

361   **PEFCR Supporting study** – the PEF study done on the basis of a draft PEFCR. It is used to confirm the
362   decisions taken in the draft PEFCR before the final PEFCR is released.

363 **PEF Profile** – the quantified results of a PEF study. It includes the quantification of the impacts for the
364 various impact categories and the additional environmental information considered necessary to be
365 reported.

366 **PEF screening** – a preliminary study carried out on the representative product(s) and intended to identify
367 the most relevant life cycle stages, processes, elementary flows, impact categories and data quality needs
368 to derive the preliminary indication about the definition of the benchmark for the product category/sub-
369 categories in scope, and any other major requirement to be part of the final PEFCR.

370 **Population -** Any finite or infinite aggregation of individuals, not necessarily animate, subject to a statistical
371 study.

372 **Practitioner of the EF study -** Individual, organisation or group of organisations that performs the EF study
373 in accordance with the EF Guide, EF Guidance and the relevant PEFCR if available. The practitioner of the EF
374 study can belong to the same organisation as the commissioner of the EF study (adapted from ISO
375 14071/2014, point 3.6).

376 **Primary data[4]** - This term refers to data from specific processes within the supply-chain of the company
377 applying the PEFCR. Such data may take the form of activity data, or foreground elementary flows (life
378 cycle inventory). Primary data are site-specific, company-specific (if multiple sites for a same product) or
379 supply-chain-specific. Primary data may be obtained through meter readings, purchase records, utility bills,
380 engineering models, direct monitoring, material/product balances, stoichiometry, or other methods for
381 obtaining data from specific processes in the value chain of the company applying the PEFCR. In this
382 Guidance, primary data is synonym of "company-specific data" or "supply-chain specific data".

383 **Product category** – Group of products (including services) that can fulfil equivalent functions (ISO
384 14025:2006).

385 **Product Category Rules (PCR)** – Set of specific rules, requirements and guidelines for developing Type III
386 environmental declarations for one or more product categories (ISO 14025:2006).

387 **Product Environmental Footprint Category Rules (PEFCRs)** – Product category-specific, life-cycle-based
388 rules that complement general methodological guidance for PEF studies by providing further specification
389 at the level of a specific product category. PEFCRs help to shift the focus of the PEF study towards those
390 aspects and parameters that matter the most, and hence contribute to increased relevance, reproducibility
391 and consistency of the results by reducing costs versus a study based on the comprehensive requirements
392 of the PEF guide.

---

[4] Based on GHG protocol scope 3 definition from the Corporate Accounting and Reporting Standard (World resources institute, 2004).

393

Reference flow: Measure of the outputs from processes in a given product system required to fulfil the function expressed by the unit of analysis (based on ISO 14040:2006). The reference flow is the amount of product needed in order to provide the defined function. All other input and output flows in the analysis quantitatively relate to it. The reference flow can be expressed in direct relation to the unit of analysis or in a more product-oriented way

Refurbishment - is the process of restoring components to a functional and/or satisfactory state to the original specification (providing the same function), using methods such as resurfacing, repainting, etc. Refurbished products may have been tested and verified to function properly.

Representative product (model) - The "representative product" may or may not be a real product that one can buy on the EU market. Especially when the market is made up of different technologies, the "representative product" can be a virtual (non-existing) product built, for example, from the average EU sales-weighted characteristics of all technologies around. A PEFCR may include more than one representative product if appropriate.

Representative sample - A representative sample with respect to one or more variables is a sample in which the distribution of these variables is exactly the same (or similar) as in the population from which the sample is a subset

Resource Use and Emissions Profile results: Outcome of a Resource Use and Emissions Profile that catalogues the flows crossing the PEF boundary and provides the starting point for the EF impact assessment.

Sample - A sample is a subset containing the characteristics of a larger population. Samples are used in statistical testing when population sizes are too large for the test to include all possible members or observations. A sample should represent the whole population and not reflect bias toward a specific attribute.

Sensitivity analysis: Systematic procedures for estimating the effects of the choices made regarding methods and data on the outcome of PEF study (based on ISO 14040: 2006).

Secondary data[5] - refers to data not from specific process within the supply-chain of the company applying the PEFCR. This refers to data that is not directly collected, measured, or estimated by the company, but sourced from a third-party life-cycle-inventory database or other sources. Secondary data includes industry-average data (e.g., from published production data, government statistics, and industry associations), literature studies, engineering studies and patents, and can also be based on financial data, and contain proxy data, and other generic data. Primary data that go through a horizontal aggregation step are considered as secondary data.

---

[5] Based on GHG protocol scope 3 definition from the Corporate Accounting and Reporting Standard (World resources institute, 2004)

426 **Specific Energy:** quotient of electric energy of a battery by the mass of the battery, expressed in Wh/kg.

427 **Sub-population -** In this document this term indicates any finite or infinite aggregation of individuals, not
428 necessarily animate, subject to a statistical study that constitutes an homogenous sub-set of the whole
429 population. Sometimes the word "stratum" can be used as well.

430 **Sub-processes** - those processes used to represent the activities of the level 1 processes (=building blocks).
431 Sub-processes can be presented in their (partially) aggregated form (see Figure 2).

432 **Sub-sample -** In this document this term indicates a sample of a sub-population.

433 **Supply-chain** - refers to all of the upstream and downstream activities associated with the operations of
434 the company applying the PEFCR, including the use of sold products by consumers and the end-of-life
435 treatment of sold products after consumer use.

436 **Supply-chain specific -** it refers to a specific aspect of the specific supply-chain of a company. For example,
437 the recycled content value of an aluminium can produced by a specific company.

438 **Temporary carbon storage:** happens when a product "reduces the GHGs in the atmosphere" or creates
439 "negative emissions", by removing and storing carbon for a limited amount of time.

440 **Type III environmental declaration** – An environmental declaration providing quantified environmental
441 data using predetermined parameters and, where relevant, additional environmental information (ISO
442 14025:2006). The predetermined parameters are based on the ISO 14040 series of standards, which is
443 made up of ISO 14040 and ISO 14044.

444 **Unit process dataset** - Smallest element considered in the life cycle inventory analysis for which input and
445 output data are quantified (ISO 14040:2006). In LCA practice, both physically not further separable
446 processes (such as unit operations in production plants, then called "unit process single operation") and
447 also whole production sites are covered under "unit process", then called "unit process, black box" (ILCD
448 Handbook).

449 **Verification report -** Documentation of the verification process and findings, including detailed comments
450 from the *Verifier(s)*, as well as corresponding responses from the *commissioner of the EF study*. This
451 document is mandatory, but it can be confidential. However, it shall be signed, electronically or physically,
452 by the *verifier or in case of a* verification panel, by the lead verifier.

453 **Verification statement -** Conclusive document aggregating the conclusions from the *verifiers* or the
454 verification team regarding the EF study. This document is mandatory and shall be electronically or
455 physically signed by the *verifier or in case of a* verification panel, by the lead verifier. The minimum content
456 of the verification statement is provided in this document.

457 **Verification team -** Team of verifiers that will perform the verification of the EF study, of the EF report and
458 the EF communication vehicles.

459   **Verifier -** Independent external expert performing a verification of the EF study and eventually taking part
460   in a verification team.

461   **Waste:** Substances or objects which the holder intends or is required to dispose [based on ISO 14025].

462

463

464

1 Introduction

465

466

467

468 The Product Environmental Footprint Category Rules (PEFCR) provides detailed and comprehensive
469 technical guidance on how to conduct a PEF study. PEF studies may be used for a variety of purposes,
470 including in-house management and participation in voluntary or mandatory programmes.

471 For all requirements not specified in this PEFCR the applicant shall refer to the most recent version of the
472 PEFCR Guidance: European Commission, PEFCR Guidance document, - Guidance for the development of
473 Product Environmental Footprint Category Rules (PEFCRs), version 6.3, December 2017.

474 The compliance with the present PEFCR is optional for PEF in-house applications, whilst it is mandatory
475 whenever the results of a PEF study or any of its content is intended to be communicated.

476 This PEFCR provides Product Environmental Footprint Category Rules (PEFCR) for developing Product
477 Environmental Footprints for high specific energy rechargeable batteries used in mobile application for the

478 following three application fields:

479 • e-mobility (e.g., e-bikes, EV, PHEV, cars, bus/trucks)
480 • ICT (e.g., tablets and phones, computers, cameras, games)
481 • Cordless power tools (e.g., drills, electric screwdrivers)
482

483 The structure of this document follows the "Template for Product Environmental Footprint Category
484 Rules"/PEF pilot Guidance/ PEFCR version 6.3, December 2017.

485

486 **Terminology: shall, should and may**

487 This PEFCR uses precise terminology to indicate the requirements, the recommendations and options that
488 could be chosen when a PEF study is conducted.

489 ● The term "shall" is used to indicate what is required in order for a PEF study to be in conformance
490   with this PEFCR.
491 ● The term "should" is used to indicate a recommendation rather than a requirement. Any deviation
492   from a "should" requirement has to be justified when developing the PEF study and made
493   transparent.
494 ● The term "may" is used to indicate an option that is permissible. Whenever options are available,
495   the PEF study shall include adequate argumentation to justify the chosen option.

2 General information about the PEFCR

496

497

498 This PEFCR provides a structure to ensure that all Product Environmental Footprints (PEF) for high specific
499 energy rechargeable batteries used in these applications are derived, verified and presented in a
500 harmonised way.

501

502 The function described is to supply electrical current at a desired voltage range from an on-board
503 rechargeable battery with a high specific energy, which is the main storage of energy for a mobile
504 application, during a given service life. The purpose of high specific energy rechargeable batteries is to
505 store and supply autonomous energy to electrical equipment. The scientific unit of measure for the
506 electrical energy is the Watt-hour (Wh). In the case of rechargeable batteries, the total service provided
507 can be measured by the total watt-hours delivered over the life of the rechargeable battery, measured in
508 kilo-watt-hours (kWh).

509 The energy consumption during the use stage of the battery is defined by the energy losses linked to the
510 battery and charger efficiency during charge, discharge and storage. The total energy transmitted by the
511 battery to the application has to be taken into account by the mobile application provider for the use phase
512 of its PEF profile.

513 Rechargeable batteries are final products used in different applications. The mobile application itself or the
514 vehicle itself (e.g. e-bike, cell phone) is not covered by this PEFCR. For the development of a PEF profile of a
515 mobile application where a battery in this scope is one of the components, the PEFCR shall be used as
516 reference for the rechargeable battery.

518

2.2 Consultations and stakeholders

519

520 This PEFCR has been developed during the EU Commission PEF pilot study period of 2014-2016. The 1st
521 physical consultation for this pilot took place on the 25th of February 2014 in Brussels. Stakeholders could
522 submit comments through the Environmental Footprint wiki webpage, and by e-mail until the 25th of
523 March 2014, a total of 94 comments were received (from VUB, Digital Europe, EUROBAT, ACEA, EPBA, ILA,
524 The international EPD system.

525 The online consultation on the 1st draft of the PEFCR was open until the 24th of August 2015, the
526 consultation was sent to 156 registered stakeholders. This second consulattion received 6 comments (from
527 DG environment and Schünemann). A third consultation for the final version of the PEFCR was made from
528 August 1st to Sept 16th 2016, and received 82 comments (from DG Environment, EEB, Bureau Veritas,
529 Belgium - Federal Public Service - Health, Food chain safety and Environment, ALABC-EUROBAT).

530 The consultations documents are placed on the webpage for the PEFCR development:
531 https://webgate.ec.europa.eu/fpfis/wikis/display/EUENVFP/PEFCR+Pilot%253A+Portable+rechargeable+ba

533

2.3 Review panel and review requirements of the PEFCR

534

535 Members of the review panel:

Role	Name	Affiliation
Chair	Ugo Pretato	Studio Fieschi & soci Srl
Team member	Etienne Lees-Perasso	Bureau Veritas/CODDE
Team member	Mikko Samuli Vaija	Orange

536

537 The reviewers have verified that the following requirements have been fulfilled:

538 ● The PEFCR has been developed in accordance with the requirement provided in the PEFCR
539 Guidance 6.3, and where appropriate in accordance with the requirements provided in the most

540   recent approved version of the PEF Guide, and supports creation of credible and consistent PEF
541   profiles,

542   ● The functional unit, allocation and calculation rules are adequate for the product category under
543   consideration,

544   ● Company-specific and secondary datasets used to develop this PEFCR are relevant, representative,
545   and reliable,

546   ● The selected LCIA indicators and additional environmental information are appropriate for the
547   product category under consideration and the selection is done in accordance with the guidelines
548   stated in the PEFCR Guidance version 6.3 and the most recent approved version of the PEF Guide,

549   ● The benchmarks are correctly defined,

550   ● Both LCA-based data and the additional environmental information prescribed by the PEFCR give a
551   description of the significant environmental aspects associated with the product.

552 The detailed review report in provided in annex 3 of this PEFCR.

2.4 Review statement

554 This PEFCR has been developed in compliance with Version 6.3 of the PEFCR Guidance, and with the PEF
555 Guide adopted by the Commission on Annex II to the Recommendation 2013/179/EU, 9 April 2013.
556 Published in the official journal of the European Union Volume 56, 4 May 2013

557 The representative product(s) correctly describe the average product(s) sold in Europe for the product
558 group in scope of this PEFCR.

559 PEF studies carried out in compliance with this PEFCR would reasonably lead to reproducible results and
560 the information included therein may be used to make comparisons and comparative assertions under the
561 prescribed conditions (see chapter on limitations).

2.5 Geographic validity

563 This PEFCR is valid for products in scope sold/consumed in the European Union + EFTA.

564 Each PEF study shall identify its geographical validity listing all the countries where the product object of
565 the PEF study is consumed/sold with the relative market share. In case the information on the market for
566 the specific product object of the study is not available, Europe +EFTA shall be considered as the default
567 market, with an equal market share for each country.

2.6 Language

569 The PEFCR is written in English. The original in English supersedes translated versions in case of conflicts.

2.7 Conformance to other documents

571 This PEFCR has been prepared in conformance with the following documents (in prevailing order):

572   • PEFCR Guidance 6.3 December 2017. For any technical question related to the content of this
573   guidance, please refer to the functional mailbox env-environmental-footprint@ec.europa.eu
574
575   • Product Environmental Footprint (PEF) Guide; Annex II to the Recommendation 2013/179/EU, 9
576   April 2013. Published in the official journal of the European Union Volume 56, 4 May 2013

3 PEFCR scope

578

579 This document provides Product Environmental Footprint Category Rules (PEFCR) for product
580 environmental footprints (PEF) of high specific energy rechargeable batteries used in mobile applications.
581 Rechargeable batteries are final products used in different applications (equipment, vehicles, etc.). The
582 equipment or vehicle itself (e.g. e-bike, cell phone, etc.) is not covered by this PEFCR. For the development
583 of a PEF profile of an application where the battery is included, this PEFCR shall be used as reference when
584 developing PEFCRs for products further down in the supply chain.

585 <u>Included battery types for this PEFCR</u>

586 The system consists of the rechargeable battery and the charger in the case of ICT and cordless power tool
587 application since it is considered to be part of the system. On the contrary, in the case of electric vehicles,
588 the charging stations are considered to be part of the infrastructure and not part of the battery (see note
589 1). The scope of this PEFCR is wide and it has been necessary to identify sub-categories based on different
590 applications (case B of the guidance).

591 This PEFCR is applicable for rechargeable single cells or/and batteries used in the following equipment or
592 vehicle:

593   • E-mobility (e.g., e-bikes, ELV, PHEV, cars, bus/trucks) – excluding charging unit (see system
594   boundaries description in section 0);
595   • Information & Communication Technologies (e.g., tablets and phones, computers, cameras, games)
596   – incl. charging unit;
597   • Cordless power tools (e.g., drills, electric screwdrivers) incl. charging unit.
598

599 The following technologies and chemistries are considered:

600   • Battery technology: Li-Ion and NiMH
601   • Battery chemistry for Li-ion technology includes: LCO (LiCoO2), NMC (LiNixMnyCozO2), LiMn
602   (LiMnO2), LFP (LiFePO4)
603
604 <u>Excluded battery types from this PEFCR:</u>

605 Other applications use different criteria for assessing battery performance, such as the service time of the
606 battery, the power, the mass, the efficiency, etc. Therefore, batteries used in such applications are
607 excluded from this PEFCR, and PEF for the batteries and applications listed below should be developed
608 separately from this document.

609 Some examples of such excluded applications are:

610   • Stationary power stations, back-up power systems (for train, aircrafts, UPS, etc.): the main
611   function is the service time of the back-up availability. The unit of analysis is not the total
612   energy delivered, but total life time of the installation. In addition, for many of the stationary
613   applications, the weight of the battery is not a key factor so a high specific energy is not
614   required.
615   • Starting-lighting-ignition (SLI) batteries and start stop hybrid batteries: One of the main
616   functions is the high power, for a short period of time, required to start a vehicle. The unit of
617   analysis is the energy delivered at the required power.
618   • Batteries with different expected quality and/or additional function (for example forklift
619   batteries are selected for their total energy over lifetime, but a counterweight is often used in
620   the application as an additional function). The maximum specific energy, which is clearly a
621   major characteristic of the function definition in the scope, is not a primary requirement for
622   these applications. Consequently, the batteries used in applications such as forklifts, golf-carts,
623   wheelchairs, etc. will not be considered in this study.
624   • Non- rechargeable batteries cannot be mixed with rechargeable batteries, as they don't
625   provide the same function: they are not a storage of energy, but a source of energy. They are
626   capable of providing electrical energy based on their chemical composition, introduced during
627   the assembly, without being electrically charged as rechargeable batteries. The total service
628   life of an application (cumulative energy delivered over service life) can be obtained with many
629   products, each one being discharged only once.
630
631   Charger inclusion/exclusion explanatory note:
632
633   The charger for the rechargeable batteries is included in the case of ICT and cordless power tool application
634   since it is considered to be part of the system provided to the user.
635   On the contrary, in the case of electric vehicles, the charging stations are considered to be part of the
636   infrastructure and not part of the battery. A single charging station can be used for many batteries/electric
637   cars, and there is no clear allocation per battery. Therefore, the charger for e-mobility is not part of the
638   system.
639   Rationale: The definition of the boundary for the charger depend on the expected benefit for the PEF result
640   quality:
641   -   approach A- charger included for electric mobility: this corresponds to an "all inclusive" approach,
642   and is homogeneous with the requirement for the other types of mobile batteries.
643   -   approach B- charger excluded for electric mobility: this approach recognizes that the charger for
644   electric mobility is not a "mobile" charger, as it is for the other applications.
645
646   Both approaches have benefits and drawbacks, with the following consequences:
647   o   The EV charger is often a complete different equipment, not directly linked to the vehicle.
648   Consequently, his design is more depending on infrastructure requirements (regulation in private and
649   public places, urban design requirements, etc…), and is not under the vehicle manufacturer responsibility.
650   o   The public EV chargers are large piece of equipment, but are used generally for a large number of
651   vehicles. In addition, their life duration is linked to other factors than the batteries durability. From this
652   point of view, they should be considered as infrastructure equipment.
653   Therefore, the possible way for approach A would be to define a "representative" virtual charger, including
654   calculated portions of public and private charger for e-mobility, in order to have an associated burden

655 included in the PEF. The theoretical benefit of such an approach A would be to have a harmonized
656 calculation with the other batteries types. Nevertheless, considering that the benchmark with the other
657 type of batteries is not meaningful, this is not a practical benefit. On the contrary, the addition of a "flat
658 burden" to all type of e-mobility batteries would only reduce the sensitivity of the PEF and the ability to
659 improve the result by battery design changes. Therefore, the approach B has been selected.

3.1 Product classification

661 The CPA codes for the products included in this PEFCR are:

Table 1: Product classification according to CPA

Material	CPA
Nickel-cadmium, nickel metal hydride, lithium-ion, lithium polymer, nickel-iron and other electric accumulators	27.20.23

663
664 The types of battery in the scope of the PEFCR only comprise part of the broader category of batteries
665 identified under the CPA (European classification of products by activity) code: 27.20.23. (27. Electrical
666 equipment/20. Batteries and accumulators/23. Nickel-cadmium, nickel metal hydride, lithium-ion, lithium
667 polymer, nickel-iron and other electric accumulators).

3.2 Representative products

669 The main components of the representative products are identified as followed:

670 The battery cell components (assembled during the battery assembly stage, including the Safety
671 Management Unit (SMU), in general based on electronics components
672 OEM components (depending on the application):
673 • The BCU (Battery control unit), mainly electronic components likes switches and contactors
674 • The BMU (Battery management unit), the electronic part for battery management. The
675 ensemble of all electric/electronic parts of the batteries, including BCU and BMU is called the
676 BMS (Battery Management System).
677 • The Heat Management Systems, or ThMU (Thermal management unit), the components
678 directly associated to the battery for its thermal management. It can consist in various
679 components allowing for static or dynamic heat exchanges (such as thermal conductive parts,
680 tubes for circulating fluids, etc.).
681 • The charger, when it is dedicated to the battery (see explanatory note parag 3.)
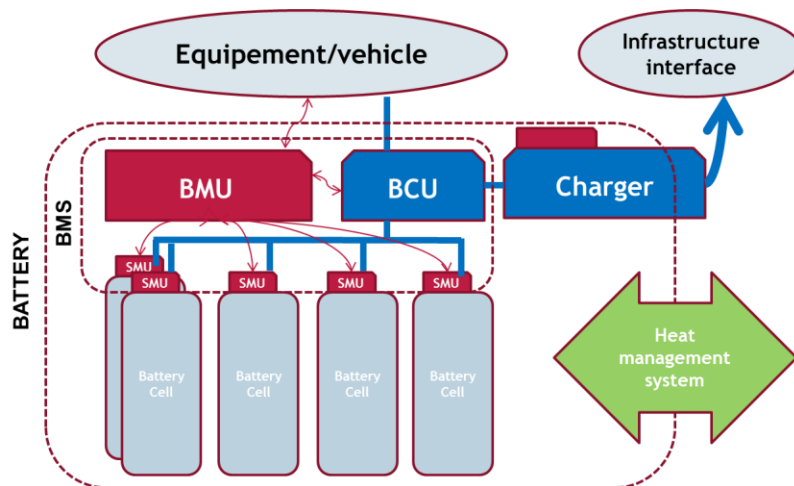

683   **Figure 3: representative products components**

684   This section introduces the representative products which have been defined to calculate the
685   environmental impacts of the batteries in each application.

686   A "representative product" has been defined for the screening study, for each of the applications
687   considered, based on the market share of the battery chemistries used in each application (data published
688   in 2013 by Avicenne company have been used for this purpose).

689   • One for each of the 3 applications considered, based on the market share of the Lithium based
690   chemistries used.
691   • One for ICT based on the Nickel- metal hydride chemistry.
692

693   The following table displays the structure and content of the representative products used for the PEF
694   screening study.

695   **Table 2: Representative products for the 4 subcategories**

Elements	CPT Li-ion	ICT Li-ion	ICT Ni-MH	e-mobility Li-ion
Specify if it is a real or a virtual product	Virtual	virtual	virtual	virtual
Description of the product	CPT- Li-ion battery Chemistry composition based on market share	ICT- Li-ion battery Chemistry composition based on market share	ICT- Ni-MH battery Chemistry composition based on market share	e-mobility- Li-ion battery Chemistry composition based on market share
Quantity of functional units based on battery industry standard /IEC 61951-2/ /IEC 61960/	14,4 kWh	11,2 kWh	0,704 kWh	8000 kWh
Bill of materials (BOM) as	See parag 6.1 and 6.3			

appropriate					
System boundary	Production stage	Included	Included	included	included
	Use stage	Included	Included	included	included
	EoL stage	Included	Included	included	included
Product Boundary	Charger	Included	Included	Included	Excluded
Assumptions related to transportation and storage scenario	Representative conditions of transport for the materials and the batteries are described (see parag 6.4). as the majority of the cells manufacturing is in Asia, the transport of the active material used for this purpose has been considered only locally, and not in Europe. In addition, as the impact of the transport has been proved negligible in the PEF, no specific condition is described, and default data are provided				
Assumptions related to use scenario	Only charging energy losses are accounted (related to battery efficiency and charger efficiency)				
Assumptions related to EoL	Recycling process of the cell based on "Recycling rechargeable lithium ion batteries: Critical analysis of natural resource savings"/ Recycling battery processes ref 11/, / Recycling battery processes ref 12/ and /Directive 2006/66 EC/ Following steps has been considered in the End-of-Life stage (see parag 6.6) Dismantling process of the battery Pyrometallurgical treatment process for the cell Then, Hydrometallurgical treatment process for the cell				
Assumptions related to land use and infrastructure	The land use has been assessed for the size of the plants needed for the manufacturing of one unit of analysis for batteries, used during 50 years. The infrastructure has been assessed based on the equipment requested to manufacture one unit of analysis of batteries.				

696

697 Due to the large number of applications, and therefore the large number of usage phase descriptions, it is
698 not possible to define a simple benchmark classification applicable for all batteries. Nevertheless, a
699 benchmark is possible per sub-category, based on each of the 4 representative products (see limitations
700 and benchmark restrictions in parag 3.6), as long as they use the same default data described in this table.

701 The screening study is available upon request to the TS coordinator (see RECHARGE contact at the end of
702 the report) that has the responsibility of distributing it with an adequate disclaimer about its limitations

703

3.3 Functional unit and reference flow

705 The function of the high specific energy rechargeable batteries used in mobile applications is to supply
706 electrical current at a desired voltage range. The rechargeable battery is the main storage of energy for
707 mobile applications. Therefore, the functional unit (FU) for rechargeable batteries is defined as **1 kWh**
708 (kilowatt-hour) **of the total energy provided over the service life by the battery** system (measured in
709 kWh).

710 The energy consumption during the use stage of the battery is defined by the energy losses linked to the
711 battery and charger efficiency during charge, discharge and storage. The total energy transmitted by the
712 battery to the application has to be taken into account by the mobile application provider, for the use
713 phase of its PEF profile (application of the "delta approach").

714 Table 1 defines the key aspects used to define the FU.

715
716
717 **Table 3 Key aspects of the Functional Unit**

718

What?	Electrical energy, measured in Wh or kWh (current and voltage during a unit of time).
How much?	1 kWh of the total energy delivered over service life (quantity of Wh, obtained from the number of cycles multiplied by the amount of delivered energy over each cycle).
How well?	Maximum specific energy (measured in Wh/kg). Specific product standards and technical properties of the high specific energy rechargeable batteries PEF shall be declared in the PEF documentation
How long?	The amount of cumulative energy delivered over service life of the high specific energy rechargeable batteries (quantity of Wh, obtained from the number of cycles multiplied by the amount of delivered energy over each cycle). The time required to deliver this total energy is not a significant parameter of the service.

719
720 The reference flow is the amount of product needed to fulfil the defined function and shall be measured in
721 **kg of battery per kWh of the total energy required by the application over its service life**. All quantitative
722 input and output data collected in the study shall be calculated in relation to this reference flow.
723 Depending on the application constraints, the size and/or the durability of the battery may not be adapted
724 to deliver the total energy required over the application service life. In this case, the number of batteries
725 per application will be increased (and hence the number of unit of analysis) to deliver the total Wh over the
726 service life required by the application.

727 The reference flow for high specific energy rechargeable batteries is calculated as follows, based on an
728 example of Cordless Power Tool battery (CPT) system:

729 <u>Step 1: Calculation of the quantity of functional unit per battery</u>

730 The purpose is to calculate the total service of the battery during the use stage, expressed in quantity of
731 functional units.

732 $$QUa = Edc \times Nc \times Acc$$

733

734

735

736

Abbr.	Parameter	CPT battery	Unit
Edc	Energy delivered per cycle	0,045	kWh/cycle
Nc	Number of cycles	400	number
Acc	Average capacity per cycle	80%	%
QUa	Quantity of functional unit	14,4	kWh over service life / per battery

737

738 The calculation of the functional unit is made according to the battery industry standard /IEC 61951-2/ and
739 /IEC 61960/.

740 These standards describe the procedure to test the endurance in life cycles through permanent charge and
741 discharge process. The test stops when the delivered energy in one cycle drops below 60% of the initial
742 energy. The minimum number of cycles required is 400. Accordingly, the minimum energy provided over
743 life can be calculated as 400 times the average capacity per cycle (80% of initial energy).

744 Please see paragraph 6.5 about the use stage calculation for the battery system.

745

746 Step 2: Calculation of the quantity of functional units for application service

747 The application service (AS) is the energy required by the application per service life (kWh).

748 The following formula is applied for the calculation of the number of batteries needed to fulfil the
749 application service:

750 $$Nbbatt = \frac{AS}{QUa}$$

751 The number of batteries needed to fulfil the reference flow shall be used as a conversion factor to
752 recalculate the Life Cycle Assessment results to enable the comparison of PEF results of different batteries
753 used in the same application / vehicle.

754 Example

755 In the following table an example is given for the calculation of the number batteries required in order to
756 provide the total energy required by the application (AS=29,6 kWh in this example) for two different
757 batteries. Battery A and Battery B provide different energy [kWh] over their service life (14,4kWh and 29,6

758 kWh accordingly). Therefore to fulfil the total energy required per application AS, for Battery A 2,06
759 batteries are necessary while for Battery B only 1 battery.

760 **Table 5: Parameters used for the association to the reference flow**

Abv.	Parameter	Battery A	Battery B	Unit
Qua	Quantity functional unit	14,4	29,6	kWh over service life / per battery
AS	Application service	29,6	29,6	[kWh] total energy required per application
Nb batt	Number batteries	2,06	1	[-] number of batteries to fulfil the total energy required by the application

761

762 Step 3: Calculation of the reference flow

763 The reference flow (Rf) is obtained in calculating the amount of battery mass required to fulfil the service
764 (kg battery/kWh)

765
$$Rf = \frac{Nb\ batt * mass}{AS}$$

766

3.4 System boundary

768 The system boundary for a PEF of rechargeable batteries includes the life cycle stages described in this
769 section. The processes included in the system boundaries shall be divided into foreground processes (i.e.
770 core processes in the product life cycle for which direct access to information is available) and background
771 processes (i.e. those processes in the product life cycle for which no direct access to information is
772 possible).

773 The following life cycle stages and processes shall be included in the system boundary:

774 **Table 6: Life cycle stages**

Life cycle stage	Short description of the processes included
Raw material acquisition	Includes mining and pre-processing, up to the Manufacturing of cells and batteries components (active materials, separator, electrolyte, casings, active and passive battery components) and

	electric/electronics components.
Main product production	Assembly of cells and assembly of batteries with the cells and the electric/electronic components
Distribution	Representative transports to consumer and collection
Use phase	Electricity usage during use phase
End of life and recycling	Collection, dismantling and recycling.

775

776 According to this PEFCR, the following processes may be excluded based on the cut-off rule (a 1% cut-off
777 for all impact categories based on environmental significance):

778 - Detailed transport operations description for raw materials, product distribution or end of life: as
779 the impact has been calculated as negligible, only the default data provided shall be used, unless
780 primary data of required quality (see parag 5.4) is available.
781 - Manufacturing of equipment for batteries assembly and recycling, as impacts have been calculated
782 as negligible.
783 - OEM manufacturing (corresponding to the battery assembly process with the OEM system
784 components) is not taken into account: it mainly corresponds to mechanical assembly, and is
785 incorporated inside the OEM equipment or vehicle assembly line. The specific energy or material
786 consumption for this process are negligible when compared to the manufacturing process of OEM
787 components.
788 - Secondary data are used for the environmental impact of assembled electronics and mechanical
789 parts, based on the materials composition used.
790 Each PEF study done in accordance with this PEFCR shall provide in the PEF study a diagram indicating the
791 organizational boundary, to highlight those activities under the control of the organization and those falling
792 into Situation 1, 2 or 3 of the data need matrix.

793 Figure 4: System Boundaries- life cycle of a battery system shows a general overview of the boundaries
794 among the whole Life Cycle of a battery system, divided into foreground and background data.

795 The manufacturing of the main product includes four main steps: electrodes manufacturing, cells
796 manufacturing and formation, battery manufacturing, and OEM manufacturing adding specific components
797 that are part of the battery when incorporated in the equipment or vehicle. The list of mandatory primary
798 (company-specific) is described in the paragraph 5.1 and corresponds to this main product manufacturing
799 stage as described in the figure 4 below.

3.4.1   Raw material acquisition stage and Production stage

803 The raw material acquisition and production stages includes the following steps:

804 <u>Raw Material Acquisition and Pre-processing</u>

805 The raw material acquisition and pre-processing stage starts when resources are extracted from nature and
806 ends when the product components enter (through the gate of) the product's production facility.
807 Transportation within and between extraction and pre-processing facilities are included.

808 <u>OEM components manufacturing</u>

809   SMU (Safety Management Unit), mainly electronics components,
810   BCU (Battery control unit), mainly electric and electronic components like switches and contactors
811   BMU (Battery management unit), the electronic part for battery management
812   Heat management system (ThMU), the components directly associated to the battery for its thermal
813   management.
814   Charger, when it is dedicated to the battery.
815

816 <u>Transport:</u> Transport of raw materials and/or components to the battery production site.

817 <u>Production</u>: The production stage begins when the product components enter the production site and ends
818 when the finished product leaves the production facility. Production-related activities include:

819 Manufacture of electrodes

820   -   Raw material preparation
821   -   Ink preparation (mixing of powder and solvent)
822   -   Coating
823   -   Calendaring and slitting

824 Cell assembly and formation

825   -   (Winding) and cell assembly
826   -   Cell electrical formation

827 Battery assembly

828   -   Cells are assembled in a battery casing
829   -   When needed by the application, the cells are assembled with electronic parts and mechanical
830   parts such as casings or cooling systems, and charger, to form the finished battery
831

832 Figure 5**Error! Reference source not found.** describes the production of the Li-ion battery. Energy supply,
833 as well as transportation of raw materials to the manufacturing site, is included within the system
834 boundaries.
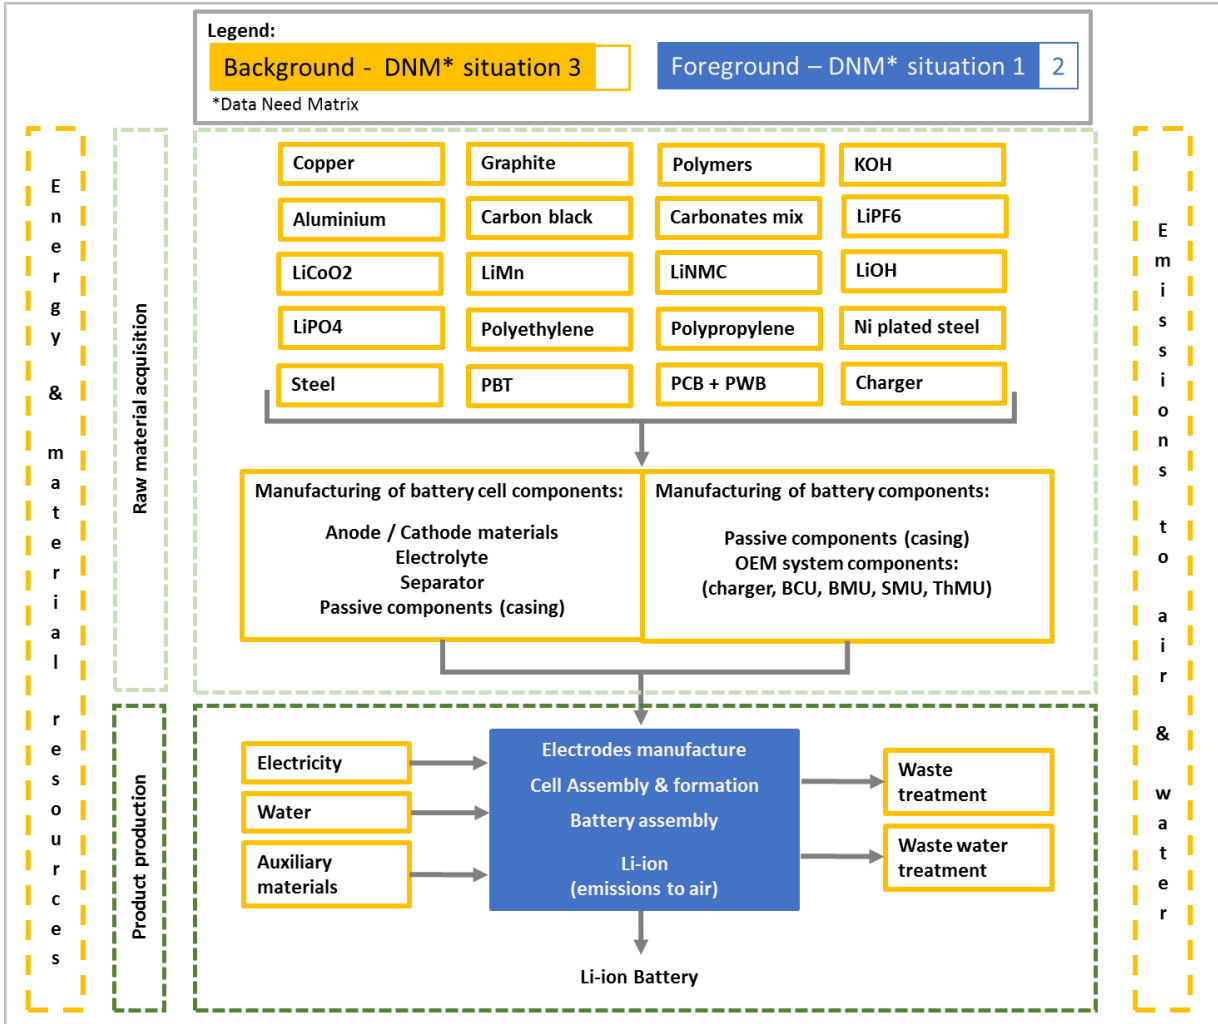

Figure 5: cradle to gate process for Li-ion battery production

The battery manufacturing and assembly stages of a nickel metal hydride (NiMH) battery are organised in a similar scheme to those of the lithium-ion battery.

Figure 6 describes the production of a NiMH battery.
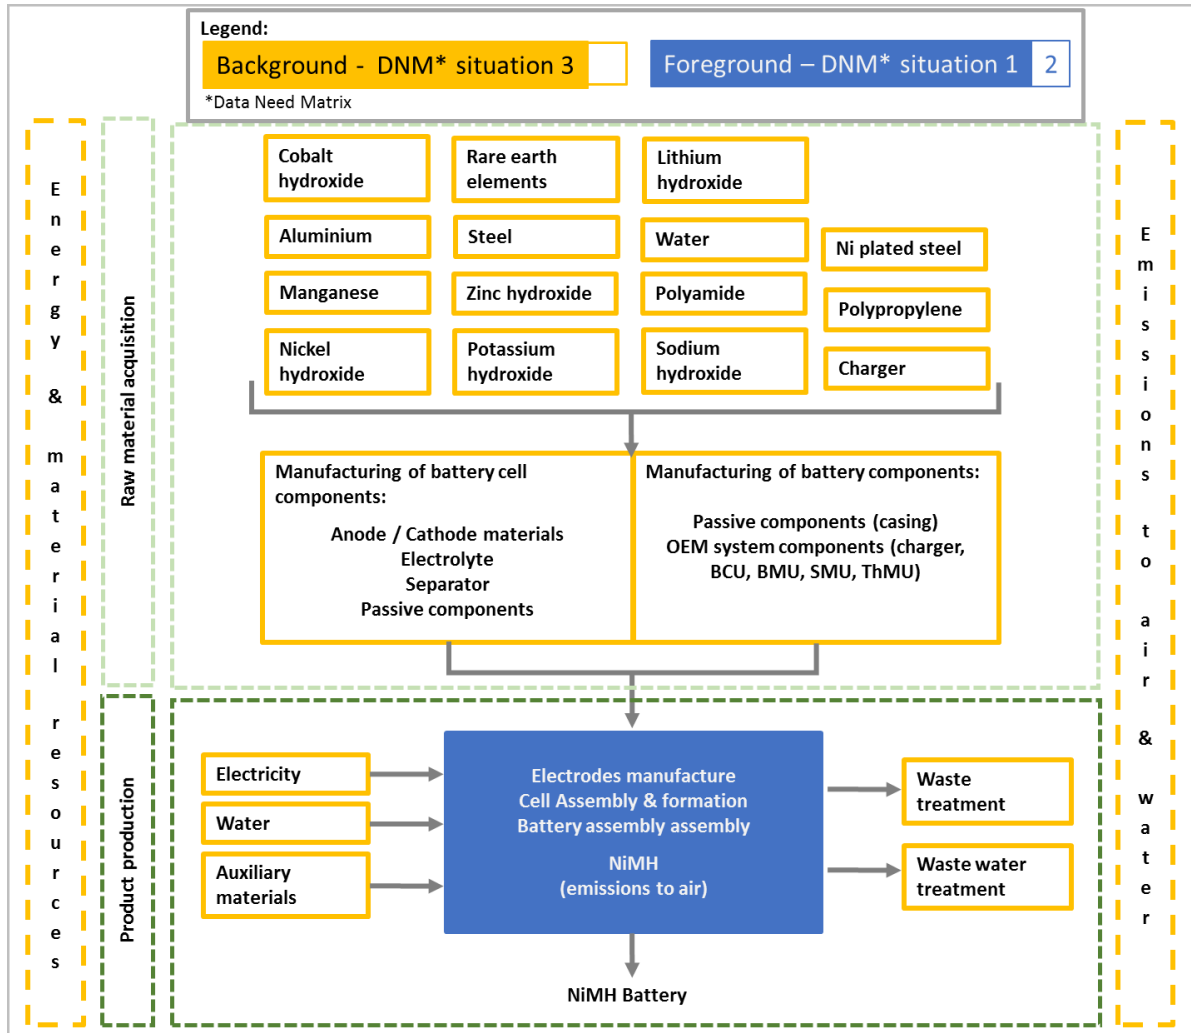

Figure 6: cradle to gate processes for Ni-MH battery production

In general, the definition of the system boundaries is based on the process and components dedicated to the battery function.

The OEM manufacturing (corresponding to the battery assembly process with the OEM system components) mainly involves integrating mechanical and electronic components in a mechanical assembly process. This process has not been specifically considered in this study as it is not part of the battery assembly process but is incorporated into the OEM equipment or vehicle assembly line. The specific energy or material consumption for this process are negligible when compared to the manufacturing process of the OEM components. Secondary data are used for the environmental impact of the assembled electronics and mechanical parts, based on the materials composition used.

3.4.2 Use stage

The energy consumption during the use stage of the battery is defined by the energy losses due to the battery and charger efficiency during the whole life of the application. The mobile application provider has to consider in its PEF profile the total energy consumption during the life cycle of its product.

During the use stage, the energy consumption associated with the use of the charger and the battery shall be considered (losses due to Joule effect, thermodynamic efficiency, etc.). The global energy efficiency depends on the battery and equipment technology and on the application usage conditions (see parag 6.5 for more details).

3.4.3 End-of-Life stage

The end-of-life processes shall include:

- Dismantling of components; the components such as casings, cooling systems, plastics and other parts are separated from the batteries; these correspond to the separation of most of the components added during the OEM assembly process, and some of the components from the battery assembly.
- Conversion into recycled material: pyrometallurgical treatment, followed by hydrometallurgical treatment. The main output of the recycling process is a metallic fraction, containing metals from the battery, and the slag. This metallic fraction can be refined with a hydrometallurgical process to extract valuable metals or alloys such as cobalt in case of Li-Cobalt or Li NMC based batteries. In the second step of hydrometallurgical treatment step the metallic alloy obtained in the previous step is processed to recover the metal-sulphate which can be used again to manufacture the batteries active materials.
- Other operation: In case shredding processes are needed as a first (recycling) treatment, it is recommended to account for the energy consumption as well as to evaluate the possible emissions.
- Credits: as a result of cell recycling, after the refining, certain flows are credited. The mass of these flows are calculated according to the stoichiometric calculation of the cell materials input proportionally to the cell recycling outputs. Please see parag 6.6 for more details.

Figure 7 provides an overview of the dismantling and recycling processes of a battery system.
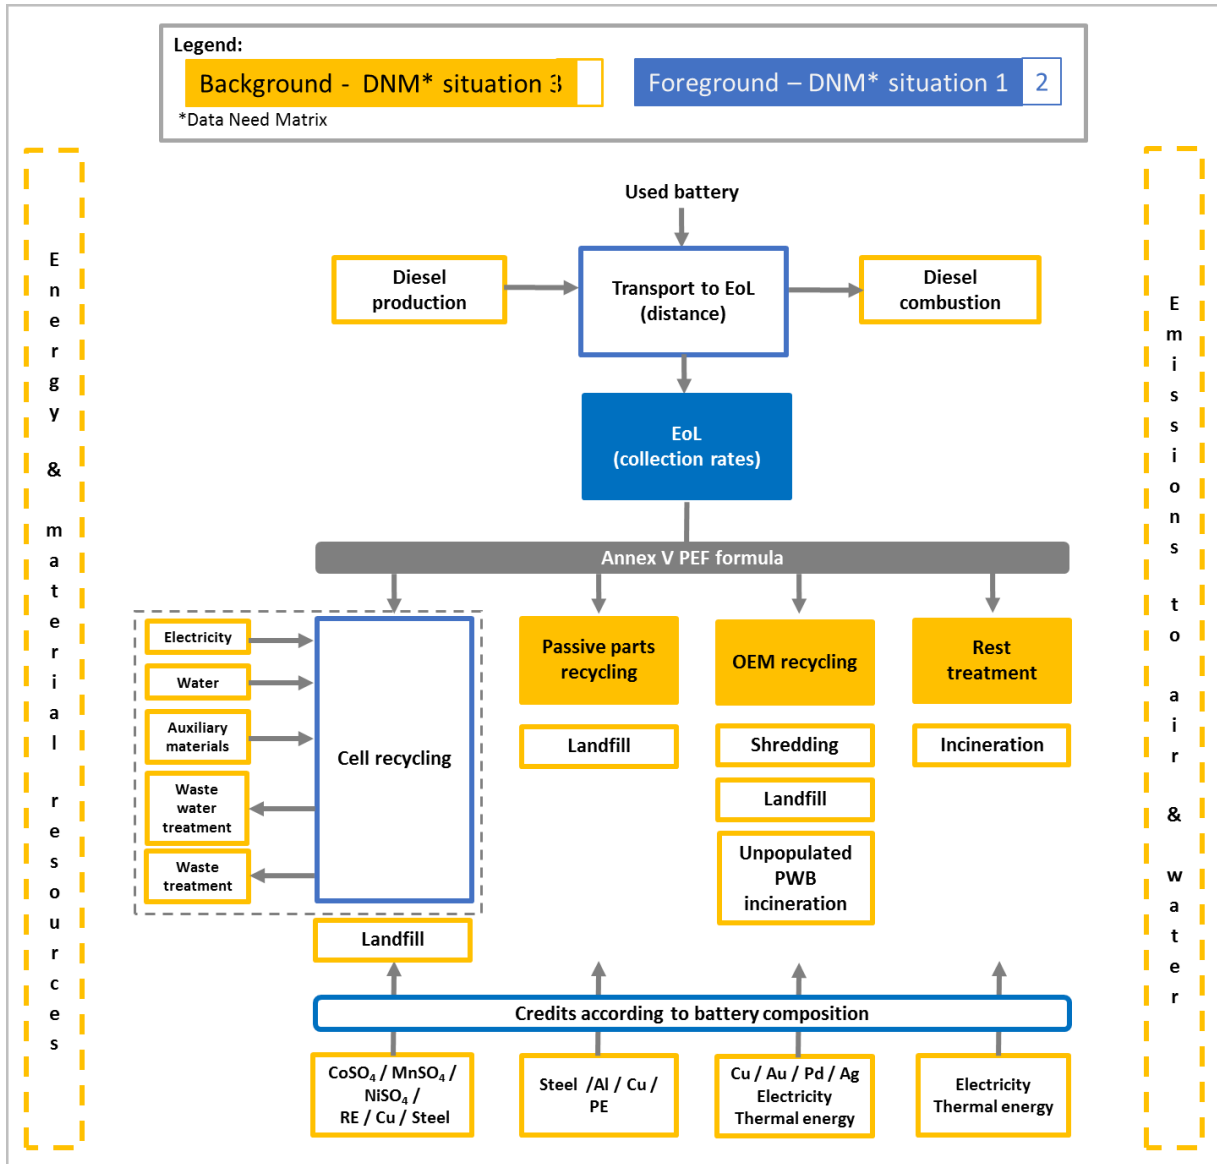

Figure 7: Dismantling and recycling processes

3.5 EF impact assessment

Each PEF study carried out in compliance with this PEFCR shall calculate the PEF-profile including all PEF impact categories listed in the Table below.

Land transformation is not calculated separately, as the results calculated from the screening studies are comparatively very small.

Table 7: List of the impact categories to be used to calculate the PEF profile

891

Impact category	Indicator	Unit	Recommended default LCIA method
Climate change - Climate change – land use and land transformation *** - Climate change – biogenic ***	Radiative forcing as Global Warming Potential (GWP100)	kg $CO_{2\,eq}$	Baseline model of 100 years of the IPCC (based on IPCC 2013)
Ozone depletion	Ozone Depletion Potential (ODP)	kg CFC-11 $_{eq}$	Steady-state ODPs 1999 as in WMO assessment
Human toxicity, cancer*	Comparative Toxic Unit for humans (CTU_h)	CTUh	USEtox model (Rosenbaum et al, 2008)
Human toxicity, non-cancer*	Comparative Toxic Unit for humans (CTU_h)	CTUh	USEtox model (Rosenbaum et al, 2008)
Particulate matter/respiratory inorganics	Impact on human health	disease incidence	UNEP recommended model (Fantke et al 2016)
Ionising radiation, human health	Human exposure efficiency relative to U^{235}	kBq U^{235}_{eq}	Human health effect model as developed by Dreicer et al. 1995 (Frischknecht et al, 2000)
Photochemical ozone formation, human health	Tropospheric ozone concentration increase	kg NMVOC $_{eq}$	LOTOS-EUROS model (Van Zelm et al, 2008) as implemented in ReCiPe
Acidification	Accumulated Exceedance (AE)	mol H+ $_{eq}$	Accumulated Exceedance (Seppälä et al. 2006, Posch et al, 2008)
Eutrophication, terrestrial	Accumulated Exceedance (AE)	mol N $_{eq}$	Accumulated Exceedance (Seppälä et al. 2006, Posch et al, 2008)
Eutrophication, freshwater	Fraction of nutrients reaching freshwater end compartment (P)	kg P $_{eq}$	EUTREND model (Struijs et al, 2009b) as implemented in ReCiPe
Eutrophication, marine	Fraction of nutrients reaching marine end compartment (N)	kg N $_{eq}$	EUTREND model (Struijs et al, 2009b) as implemented in ReCiPe
Ecotoxicity, freshwater*	Comparative Toxic Unit for ecosystems (CTU_e)	CTUe	USEtox model, (Rosenbaum et al, 2008)
Land use	• Soil quality index[6] • Biotic production • Erosion resistance • Mechanical filtration • Groundwater replenishment	• Dimensionless (pt) • kg biotic production[7] • kg soil • m^3 water • m3 groundwater	• Soil quality index based on LANCA (EC-JRC)[8] • LANCA (Beck et al. 2010) • LANCA (Beck et al. 2010) • LANCA (Beck et al. 2010) • LANCA (Beck et al. 2010)

---

[6] This index is the result of the aggregation, performed by JRC, of the 4 indicators provided by LANCA model as indicators for land use

[7] This refers to occupation. In case of transformation the LANCA indicators are without the year (a)

[8] Forthcoming document on the update of the recommended Impact Assessment methods and factors for the EF

Impact category	Indicator	Unit	Recommended default LCIA method
Water use*	*User deprivation potential (deprivation-weighted water consumption)*	*m^3 world $_{eq}$*	*Available WAter REmaining (AWARE) Boulay et al., 2016*
Resource use, minerals and metals	*Abiotic resource depletion (ADP ultimate reserves)*	*kg Sb $_{eq}$*	*CML 2002 (Guinée et al., 2002) and van Oers et al. 2002.*
Resource use, fossils	*Abiotic resource depletion – fossil fuels (ADP-fossil)*	*MJ*	*CML 2002 (Guinée et al., 2002) and van Oers et al. 2002*

892

893 *Long-term emissions (occurring beyond 100 years) shall be excluded from the toxic impact categories.
894 Toxicity emissions to this sub-compartment have a characterisation factor set to 0 in the EF LCIA (to ensure
895 consistency). If included by the applicant in the LCI modelling, the sub-compartment 'unspecified (long-
896 term)' shall be used.

897 The full list of normalization factors and weighting factors are available in Annex 1 - List of EF normalisation
898 factors and weighting factors.

899 The   full   list   of   characterization   factors   (EC-JRC,   2017a)   is   available   at   this   link
900 http://eplca.jrc.ec.europa.eu/uploads/LCIA-characterization-factors-of-the-ILCD.pdf

901 **The results for water use might be overestimated and shall therefore be interpreted with caution. Some
902 of the EF datasets tendered during the pilot phase and used in this PEFCR/OEFSR include inconsistencies in
903 the regionalization and elementary flow implementations. This problem has nothing to do with the impact
904 assessment method or the implementability of EF methods, but occurred during the technical development
905 of some of the datasets. The PEFCR/OEFSR remains valid and usable. The affected EF datasets will be
906 corrected by mid-2019. At that time it will be possible to review this PEFCR/OEFSR accordingly, if seen
907 necessary.

908 *** The sub-indicators 'Climate change - biogenic' and 'Climate change - land use and land transformation'
909 shall not be reported separately because their contribution to the total climate change impact, based on
910 the benchmark results, is less than 5% each

3.6 Limitations

912 In PEF studies, limitations to carrying out the analysis may arise and therefore assumptions need to be
913 made. For example, generic data may not completely represent the reality of the product analysed and
914 may be adapted for better representation. Any limitation and assumptions shall be transparently reported
915 and justified.

916 The identified limitations of the PEFCR are listed below:

917 -   Due to the high number of battery components and the complexity of the processes, the PEFCR limits
918   the process and component analysis to the battery-specific parts. For non-specific components,
919   secondary data shall be used from the reference database or following the process for data-gaps

920   described in paragraph 5~~o~~ This applies to electronics components (either when used in the battery
921   manufacturing stage or during the OEM manufacturing stage), metals, and plastics used for mechanical
922   parts. Company or site specific datasets shall only be used if there is clear evidence that the specific
923   datasets are more representative for the product under investigation. The secondary datasets to be
924   used are those listed in this PEFCR.

925   -   Some data sets are replaced by proxy, with the consequence of a significant impact on the
926   environmental profile (based on the results of the various scenarios during the screening studies of the
927   the pilot phase). For example, cobalt metal is used for cobalt sulphate, nickel metal for nickel
928   hydroxyde, and lithium hydroxide for lithium hexafluorophosphate (see Table 15**: List of data gaps and**
929   **proxies to be used**
930   -   ).
931   -   the ADP -ultimate reserve- methodology is used to calculate the resources usage impact. The outcome
932   of this method in the case of metals and minerals should be used with caution because the result of
933   ADP after normalization may be overestimated, due to possible database inconsistencies.
934   -   Due to the change of the End of life formula (50/50 approach) to the CFF formula (see paragraph 5.11)
935   at the end of the PEF pilot process, some of the PEF data sets are based on the 50/50 approach.
936   Consequently, the calculation for the benefit of batteries recycling, where the usage of recycled
937   material is not included (R1=0), is not correctly assessed, and can be only considered as relative to the
938   current methodology.
939   -   It is assumed that waste water and auxiliary materials from battery manufacture/assembly are sent to
940   waste water treatment, except for the organic solvent NMP (a 50% recycling process has been used for
941   the representative product manufacturing to reflect average industrial situation).
942   -   A study of the chargers used in different applications indicated that the charger size is directly linked to
943   the battery size and energy. Due to the lack of detailed data on the specific charger technology used in
944   each application, the Bill of Materials for the CPT charger of the published EPTA study shall be used for
945   CPT and ICT battery systems. Based on the final reviewer expertise, it is recognized that the Bill Of
946   Material selected may include a too complex PCB (8-layers), inducing higher impacts. A study of the
947   chargers compositions per application would be required to have a more accurate representation.
948   -   Packaging materials for battery components and final product shall not be considered, as the
949   contribution to the overall impact has been estimated to be negligible during the screening study.
950

951 **Benchmark limitations**: For each of the 4 representative products, the PEF results may be used to
952 benchmark products using the same system boundaries, same use stage and EoL scenarios, and similar
953 assumptions for the background data (such as raw materials data and transport conditions, charger and
954 electronics data, proxys…), unless primary data are used. The use stage shall be precisely described, and
955 the battery performance measured in this same conditions. When the precise usage conditions are not
956 available for the organization realizing a PEF, then the batteries performance and environmental impact
957 benchmark shall be realized using the reference use phase conditions described for the representative
958 product (see parag. 3). In the same way, the secondary data provided for the calculation of the
959 environmental impact of the representative product shall be used in order to obtain information about

960 benchmark. It is recommended to modify these secondary data only when primary data can be provided,
961 according the Data Need Matrix (Table 17). In this case, the environmental impact of the product shall be
962 recalculated using these data, but cannot be benchmarked with other PEF using different assumptions.

963

964

965 # 4 Most relevant impact categories, life cycle stages
966 and processes

967 The most relevant impact categories for each sub-category in the scope of this PEFCR are identified in blue
968 in the following table:

969 <div align="center">**Table 8: most relevant impact categories**</div>

Impact category	Contribution to the total impact (%)			
	CPT - Li-ion	ICT - Li-ion	ICT - NiMH	e-mobility Li-ion
Acidification terrestrial and freshwater	3%	5%	15%	2%
Climate Change (biogenic)	0%	0%	0%	0%
Climate Change (fossil)	24%	25%	20%	32%
Climate Change (land use change)	0%	0%	0%	0%
Eutrophication freshwater	0%	0%	0%	0%
Eutrophication marine	1%	1%	1%	1%
Eutrophication terrestrial	2%	2%	1%	2%
Ionising radiation - human health	1%	2%	1%	3%
Land Use	0%	0%	0%	0%
Ozone depletion	0%	0%	0%	0%
Photochemical ozone formation - human health	2%	3%	3%	3%
Resource use, energy carriers	15%	18%	13%	26%
Resource use, mineral and metals	44%	33%	28%	20%
Respiratory inorganics	7%	9%	17%	8%
Water scarcity	1%	2%	1%	2%

970

971 The most relevant impact categories are the same for all product subcategory: Climate change, Resource
972 use energy carriers, Resource use minerals and metals, and Respiratory inorganics, with in addition the
973 impact Acidification for the Ni-MH batteries.

974 As climate change is selected as a relevant impact category, the PEF applicant shall report the total climate
975 change as the sum of the three sub-indicators 'Climate change- fossil', 'Climate change - biogenic' and
976 'Climate change - land use and land transformation'.

977 The most relevant life cycle stages for each sub-categories in the scope of this PEFCR are identified in blue
978 in the following tables: (characterized results per functional unit 1kWh, for each sub category in blue is
979 indicated the 80% cumulative contribution – please note that the sum of line is not equal to 100% due to
980 the credits from the CFF formula).

981

982

983

984 Table 9: most relevant life cycle stages

CPT - Li-ion battery

Impact category	Raw Material acquisition	Production of the main product	Product distribution	Use stage	End-of-Life
Climate Change (fossil) [kg CO2 eq.]	82%	8%	0%	7%	3%

988

989
990
991
992

993
994
995
996

997

The most relevant life cycles stages include always the raw material acquisition for the most relevant impacts categories. In addition, the end of life is relevant for all product subcategories, at least for the Respiratory Inorganics impact. Finally, the use stage is relevant for the Resource use, energy carriers impact, except for the CPT LI-ion batteries.

The most relevant processes for each of the sub-categories in scope of this PEFCR are highlighted in blue in the following tables (Hotspots >50% cumulative contribution to most relevant impact categories), for each of the 4 identified larger impact categories (Climate change, Resource use energy carriers, Resource use minerals and metals, and Respiratory inorganics).

1001

1002

5 Life cycle inventory

1003
1004

1005 All newly created processes shall be EF-compliant (see definitions).

1006 In case sampling is needed, it shall be conducted as specified in this PEFCR. However, sampling is not
1007 mandatory and any applicant of this PEFCR may decide to collect the data from all the plants, without
1008 performing any sampling.

5.1 List of mandatory company-specific data

1009

1010 As the process for manufacturing of the main product includes both

1011   1-assembly of cells and

1012   2-assembly of batteries with the cells and the electric/electronic components, and passive
1013   components,

1014 two different type of companies may be involved, which may have no access to the primary information for
1015 the whole process. Therefore, two options are proposed following this PEFCR to allow for the companies
1016 having primary information for only part 1 or only part 2.

1017 At least one of the two cases below shall be selected by the company realizing the PEF.

1018   • **Case 1**: PEFCR based on Cell manufacturer company specific data:

1019   Mandatory process run by the company (situation 1 -option 1 of the data need matrix): cell assembly
1020   and formation.

1021   • **Case 2:** PEFCR based on Battery manufacturer company specific data:

1022   Mandatory process run by the company (situation 1 -option 1 of data need matrix): battery assembly

1023 In all cases, the list of material for the battery manufacturing and the list of energy inputs according the list
1024 of the reference product are required for all PEF-studies.

Process step	Life cycle stage	Process	Units
Manufacture of battery	Electrodes & cell manufacturing	- Raw material preparation - Ink preparation - Coating - Calendaring and slitting - Winding and cell assembly	kg
Battery Assembly and testing	Manufacturing	- Materials - Energy - Water - Wastes	kg and MJ
OEM Assembly	Manufacturing	- Charger - Electronics	kg and piece
Electricity consumption	Use stage	Use stage	kWh
End-of-Life	End-of-Life	- Collection rate - Recycling of the cell - Landfill - Incineration	kg/ MJ

Case 1-

1

Direct elementary flow collection requirements for mandatory processes

All the relevant flows according case 1 or 2, as identified below, shall be collected for the manufacturing phase.

Table 13: elementary flows

Emissions / resources	Elementary flow	Frequency of measurement	Default measurement method[9]	Remarks
Emissions to air				
Particles (dust PM10)	kg/kg battery] Amount of emission to air	Yearly average	N/A	
Particles (dust PM2.5)	kg/kg battery] Amount of emission to air	Yearly average	N/A	
SO2_air	kg/kg battery] Amount of emission to air	Yearly average	N/A	
NOx_air	kg/kg battery] Amount of emission to air	Yearly average	N/A	

Table 14: other flows

Emissions / resources	other flow	Frequency of measurement	Default measurement method[10]	Remarks
Energy & water	[MJ/kg battery] Manufacturing electricity	Yearly average	N/A	
Electrodes manufacturing	[MJ/kg battery] Manufacturing electricity	Yearly average	N/A	
Cell assembly & forming	[MJ/kg battery] Manufacturing electricity	Yearly average	N/A	
Battery assembly	[MJ/kg battery] Manufacturing electricity	Yearly average	N/A	
Water (tap)	[kg/kg battery] Amount of water used	Yearly average	N/A	
Auxiliary materials				
Water deionized (anode + production)	kg/kg battery] Amount of water deionized	Yearly average	N/A	
n-methyl Pyrolidone	kg/kg battery] Amount of n-methyl	Yearly average	N/A	

---

[9] Unless specific measurement methods are foreseen in a country specific legislation
[10] Unless specific measurement methods are foreseen in a country specific legislation

(cathode)				
Chlorhydric acid (NiMH)	[kg/kg battery] Amount of Cl acid	Yearly average	N/A	
Nitric acid (NiMH)	kg/kg battery] Amount of nitric acid	Yearly average	N/A	

Comment: both electronic components (charger and/or battery management units, safety units) and the cathode materials have to be accurately defined, as they may become the main contributor for the climate change and resource usage impacts.

Sampling procedure for data acquisition:

All the elementary flows identified in the Table 13 are relative to continuous or semi-continuous industrial processes. For such processes, measurements shall be collected:

- First, at the points of consumption or emission directly relative to the process considered for the battery in the scope.

- If some of these data are not available (for example, the battery process is run in the same plant with multiple other processes) then a calculation for an allocation of the flows is allowed, with appropriate documentation. The allocation shall be based on a kg of battery produced.

A company quality system (i.e. ISO 9001 or equivalent) shall be in place in order to demonstrate that the measured values are representative of a yearly average of the elementary flows dedicated to the manufacturing of the battery in the scope.

5.2 List of processes expected to run by the company

In the case the cell manufacturer is also the battery manufacturer and OEM/assembly, then the full list of processes described in 5.1 shall be used.

5.3 Data gaps

In case data gaps appear while using this PEFCR (should the data used for the representative product not be applicable), they shall be filled using the data hierarchy presented in paragraph 5.6.
Any data used to fill data gaps shall be reported and justified.

The following shall be applied unless more specific information is available. The use of more specific information shall be clearly justified in the PEF report.

List of data gaps in available datasets and the proxies to be used by PEF studies:

- for Charger: when the company calculating the PEF has no primary data about the charger composition and weight, it shall use the "EPTA Charger" data.

36   - the following proxis shall be used:

Data gap	unit	Proxi to be used
Stainless Steel slab (X6CrNi17)	kg/kg battery	Recycling of steel into steel scrap: Steel billet (St) {dadc8eb8-3ebe-4114-afc4-90d45a0b74b4}
Cobalt sulfate	kg/kg battery	Cobalt GLO {c76002c7-dfef-4d17-a100-fecd7910cfad}
Nickel hydroxide	kg/kg battery	Nickel GLO {bb78c02b-70da-4e9e-a5a3-c5c45a5dcdb0}
Lithium Hexafluorophosphate	kg/kg battery	lithium hydroxide production GLO{d08bdd01-a59f-4f80-87e8-5ad30c6934d3}
Manganese sulfate	kg/kg battery	Manganese {38085a7e-98a3-4b5d-9381-8cefce00cc27}
Switch PCB (EPTA)*	kg/kg battery	Populated Printed wiring board (PWB) (2-layers) {91064ae4-3cf1-4b09-a430-9e01488ad11b}
Plastic granulate secondary (low metal contamination)	kg/kg battery	not available, select proxy data according hierarchy indicated in paragraph 5.6

38   * Concerning the charger, the Technical secretariat has referred to publicly available information, based on
39   realistic product for the Cordless Power Tools application. There have been no specific studies to
40   demonstrate that the components are representative for the chargers of other applications. For these
41   cases, the charger has to be considered as a proxy. See detailed description for the charger in annex 4 .

42   In addition, carbon black is used instead of graphite for the anode material, as graphite was not available in
43   the database at the time of calculation.

5.4 Data quality requirements

45   The data quality of each dataset and the total EF study shall be calculated and reported. The calculation of
46   the DQR shall be based on the following formula:

47   The DQR shall be based on the following formula with 4 criteria:

48
$$DQR = \frac{\overline{Te_R} + \overline{G_R} + \overline{Ti_R} + \bar{P}}{4}$$
[Equation 1]

49   Where TeR is the Technological-Representativeness, GR is the Geographical-Representativeness, TiR is the
50   Time-Representativeness, and P is the Precision/uncertainty. The representativeness (technological,
51   geographical and time-related) characterises to what degree the processes and products selected are
52   depicting the system analysed, while the precision indicates the way the data is derived and related level of
53   uncertainty.

54   The next chapters provide tables with the criteria to be used for the semi-quantitative assessment of each
55   criterion. If a dataset is constructed with company-specific activity data, company -specific emission data
56   and secondary sub-processes, the DQR of each shall be assessed separately.

57   **COMPANY SPECIFIC DATASETS**

58   The score of criterion P cannot be higher than 3 while the score for TiR, TeR, and GR cannot be higher than
59   2 (the DQR score shall be ≤1.6). The DQR shall be calculated at the level-1 disaggregation, before any
60   aggregation of sub-processes or elementary flows is performed. The DQR of company-specific datasets
61   shall be calculated as following:

62   1) Select the most relevant sub-processes and direct elementary flows that account for at least 80% of the
63   total environmental impact of the company-specific dataset, listing them from the most contributing to the
64   least contributing one.

65   2) Calculate the DQR criteria TeR, TiR, GR and P for each most relevant process and each most relevant
66   direct elementary flow. The values of each criterion shall be assigned based on Table 16

67   2.a) Each most relevant elementary flow consists of the amount and elementary flow naming (e.g.
68   40 g carbon dioxide). For each most relevant elementary flow, evaluate the 4 DQR criteria named
69   Te_{R-EF}, Ti_{R-EF}, G_{R-EF}, $P_{EF.}$ It shall be evaluated for example, the timing of the flow measured, for which
70   technology the flow was measured and in which geographical area.

71   2.b) Each most relevant process is a combination of activity data and the secondary dataset used.
72   For each most relevant process, the DQR is calculated by the applicant of the PEFCR as a
73   combination of the 4 DQR criteria for activity data and the secondary dataset: (i) Ti_R and P shall be
74   evaluated at the level of the activity data (named Ti_{R-AD}, P_{AD}) and (ii) Te_R, Ti_R and G_R shall be
75   evaluated at the level of the secondary dataset used (named Te_{R-SD} , Ti_{R-SD} and G_{R-SD}). As Ti_R is
76   evaluated twice, the mathematical average of Ti_{R-AD} and Ti_{R-SD} represents the Ti_R of the most
77   relevant process.

78   3) Calculate the environmental contribution of each most-relevant process and elementary flow to the
79   total environmental impact of all most-relevant processes and elementary flows, in % (weighted using 13
80   EF impact categories, with the exclusion of the 3 toxicity-related ones). For example, the newly developed
81   dataset has only two most relevant processes, contributing in total to 80% of the total environmental
82   impact of the dataset:

83   • Process 1 carries 30% of the total dataset environmental impact. The contribution of this process
84   to the total of 80% is 37.5% (the latter is the weight to be used).
85   • Process 1 carries 50% of the total dataset environmental impact. The contribution of this process
86   to the total of 80% is 62.5% (the latter is the weight to be used).

87   4) Calculate the Te_R, Ti_R, G_R and P criteria of the newly developed dataset as the weighted average of each
88   criterion of the most relevant processes and direct elementary flows. The weight is the relative
89   contribution (in %) of each most relevant process and direct elementary flow calculated in step 3.

90   5) The applicant of the PEFCR shall the total DQR of the newly developed dataset using the equation B.2,
91   where $\overline{Te_R}, \overline{G_R}, \overline{Ti_R}, \overline{P}$ are the weighted average calculated as specified in point 4).

92
$$DQR = \frac{\overline{Te_R} + \overline{G_R} + \overline{Ti_R} + \bar{P}}{4}$$
[Equation 2]

93 NOTE: in case the newly developed dataset has most relevant processes filled in by non-EF compliant
94 datasets (and thus without DQR), then these datasets cannot be included in step 4 and 5 of the DQR
95 calculation. (1) The weight of step 3 shall be recalculated for the EF-compliant datasets only. Calculate the
96 environmental contribution of each most-relevant EF compliant process and elementary flow to the total
97 environmental impact of all most-relevant EF compliant processes and elementary flows, in %. Continue
98 with step 4 and 5. (2) The weight of the non-EF compliant dataset (calculated in step 3) shall be used to
99 increase the DQR criteria and total DQR accordingly. For example:

100 • Process 1 carries 30% of the total dataset environmental impact and is ILCD entry level
101   compliant. The contribution of this process to the total of 80% is 37.5% (the latter is the
102   weight to be used).
103 • Process 1 carries 50% of the total dataset environmental impact and is EF compliant. The
104   contribution of this process to all most-relevant EF compliant processes is 100%. The latter is
105   the weight to be used in step 4.
106 • After step 5, the parameters $\overline{Te_R}, \overline{G_R}, \overline{Ti_R}, \bar{P}$ and the total DQR shall be multiplied with 1.375.

107
108 **Table 16: How to assess the value of the DQR criteria for datasets with company-specific information**

DQR	P_{EF} and P_{AD}	Ti_{R-EF} and Ti_{R-AD}	Ti_{R-SD}	Te_{R-EF} and Te_{R-SD}	G_{R-EF} and G_{R-SD}
1	*Measured/calculated and externally verified*	*The data refers to the most recent annual administration period with respect to the EF report publication date*	*The EF report publication date happens within the time validity of the dataset*	*The elementary flows and the secondary dataset reflect exactly the technology of the newly developed dataset*	*The data(set) reflects the exact geography where the process modelled in the newly created dataset takes place*
2	*Measured/calculated and internally verified, plausibility checked by reviewer*	*The data refers to maximum 3 annual administration periods with respect to the EF report publication date*	*The EF report publication date happens not later than 2 years beyond the time validity of the dataset*	*The elementary flows and the secondary dataset is a proxy of the technology of the newly developed dataset*	*The data(set) partly reflects the geography where the process modelled in the newly created dataset takes place*
3	*Measured/calculated/literature and plausibility not checked by reviewer OR Qualified estimate based on calculations plausibility checked by reviewer*	*The data refers to maximum 5 annual administration periods with respect to the EF report publication date*	*Not applicable*	*Not applicable*	*Not applicable*

109

110   For the quality assessment of the energy used, the geographic criteria as in Table 19 is applicable.

111   The processes with substituted activity data/sub-processes shall be declared and will automatically enter
112   the list of issue to be checked by the external verifier. The dataset used for substitution shall be PEF
113   compliant, publicly available, and have at least the same quality as the substituted default process

114   ## 5.5 Data needs matrix (DNM)

115   All processes required for modelling of the product and outside the list of mandatory company-specific

116   (listed in section 5.1) shall be evaluated using the Data Needs Matrix (see Table 17). The DNM shall be used

117   by the PEFCR applicant to evaluate which data is needed and shall be used within the modelling of its PEF,

118   depending on the level of influence the applicant (company) has on the specific process. The following

119   three cases are found in the DNM and are explained below:

120   1.   **Situation 1**: the process is run by the company applying the PEFCR
121   2.   **Situation 2**: the process is not run by the company applying the PEFCR but the company has access
122   to (company-)specific information.
123   3.   **Situation 3**: the process is not run by the company applying the PEFCR and this company does not
124   have access to (company-)specific information.

Table 17: Data Needs Matrix (DNM)[11] *Disaggregated datasets shall be used.

			Most relevant process	Other process
Situation 1: process run by the company applying the PEFCR		**Option 1**	Provide company-specific data (as requested in the PEFCR) and create a company specific dataset partially disaggregated at least at level 1 (DQR ≤1.6). Calculate the DQR values (for each criteria + total)	
		Option 2		Use default secondary dataset in PEFCR, in aggregated form (DQR ≤3.0). Use the default DQR values
Situation 2: process not run by the company applying the PEFCR but with access to (company-)specific information		**Option 1**	Provide company-specific data (as requested in the PEFCR) and create a company specific dataset partially disaggregated at least at level 1 (DQR ≤1.6). Calculate the DQR values (for each criteria + total)	
		Option 2	Use company-specific activity data for transport (distance), and substitute the sub-processes used for electricity mix and transport with supply-chain specific PEF compliant datasets (DQR ≤3.0).* Re-evaluate the DQR criteria within the product specific context	
		Option 3		Use company-specific activity data for transport (distance), and substitute the sub-processes used for electricity mix and transport with supply-chain specific PEF compliant datasets (DQR ≤4.0). Use the default DQR values
Situation 3: process not run by the company applying the PEFCR and without access to (company)-specific information		**Option 1**	Use default secondary dataset, in aggregated form (DQR ≤3.0). Re-evaluate the DQR criteria within the product specific context	
		Option 2		Use default secondary dataset in PEFCR, in aggregated form (DQR ≤4.0) Use the default DQR values

---

[11] The options described in the DNM are not listed in order of preference

145

5.5.1 Processes in situation 1

For each process in situation 1 there are two possible options:

- The process is in the list of most relevant processes as specified in the PEFCR or is not in the list of most relevant process, but still the company wants to provide company specific data (option 1);
- The process is not the list of most relevant processes as specified in the PEFCR and the company prefers to use a secondary dataset (option 2).

Situation 1/Option 1

For all processes run by the company and where the company applying the PEFCR uses company specific data. The DQR of the newly developed dataset shall be evaluated as described in section 5.4.1.

Situation 1/Option 2

For the non-most relevant processes only, if the applicant decides to model the process without collecting company-specific data, then the applicant shall use the secondary dataset listed in the PEFCR together with its default DQR values listed here.

If the default dataset to be used for the process is not listed in the PEFCR, the applicant of the PEFCR shall take the DQR values from the metadata of the original dataset.

5.5.2 Processes in situation 2

When a process is not run by the company applying the PEFCR, but there is access to company-specific data, then there are three possible options:

- The company applying the PEFCR has access to extensive supplier-specific information and wants to create a new EF-compliant dataset[12] (Option 1);
- The company has some supplier-specific information and want to make some minimum changes (Option 2).
- The process is not in the list of most relevant processes and the company prefers to use a secondary dataset (option 3).

Situation 2/Option 1

For all processes run by the company and where the company applying the PEFCR uses company specific data. The DQR of the newly developed dataset shall be evaluated as described in section 5.4.1.

175

---

[12] The review of the newly created dataset is optional

176

Situation 2/Option 2

Company-specific activity data for transport are used and the sub-processes used for electricity mix and transport with supply-chain specific PEF compliant datasets are substituted starting from the default secondary dataset provided in the PEFCR.

Please note that, the PEFCR lists all dataset names together with the UUID of their aggregated dataset. For this situation, the disaggregated version of the dataset is required.

The applicant of the PEFCR shall make the DQR values of the dataset used context-specific by re-evaluating TeR and TiR, using the Table 18. The criteria GR shall be lowered by 30% and the criteria P shall keep the original value.

Situation 2/Option 3

For the non-most relevant processes, the applicant may use the corresponding secondary dataset listed in the PEFCR together with its DQR values.

If the default dataset to be used for the process is not listed in the PEFCR, the applicant of the PEFCR shall take the DQR values from the original dataset.

Table 18: How to assign the values to parameters in the DQR formula when secondary datasets are used

	TiR	TeR	G_R
1	The EF report publication date happens within the time validity of the dataset	The technology used in the EF study is exactly the same as the one in scope of the dataset	The process modelled in the EF study takes place in the country the dataset is valid for
2	The EF report publication date happens not later than 2 years beyond the time validity of the dataset	The technologies used in the EF study is included in the mix of technologies in scope of the dataset	The process modelled in the EF study takes place in the geographical region (e.g. Europe) the dataset is valid for
3	The EF report publication date happens not later than 4 years beyond the time validity of the dataset	The technologies used in the EF study are only partly included in the scope of the dataset	The process modelled in the EF study takes place in one of the geographical regions the dataset is valid for
4	The EF report publication date happens not later than 6 years beyond the time validity of the dataset	The technologies used in the EF study are similar to those included in the scope of the dataset	The process modelled in the EF study takes place in a country that is not included in the geographical region(s) the dataset is valid for, but sufficient similarities are estimated based on expert judgement.
5	The EF report publication date happens later than 6 years after the time validity of the dataset	The technologies used in the EF study are different from those included in the scope of the dataset	The process modelled in the EF study takes place in a different country than the one the dataset is valid for

192

193   ### 5.5.3 Processes in situation 3

194 When a process is not run by the company applying the PEFCR and the company does not have access to
195 company-specific data, there are two possible options:
196

197   ●   It is in the list of most relevant processes (situation 3, option 1)
198   ●   It is not in the list of most relevant processes (situation 3, option 2)

199 **Situation 3/Option 1**

200 In this case, the applicant of the PEFCR shall make the DQR values of the dataset used context-specific by
201 re-evaluating Te_R, Ti_R and G_r, using the table(s) provided. The criteria P shall keep the original value.

202 ***Situation 3/Option 2***

203 For the non-most relevant processes, the applicant shall use the corresponding secondary dataset listed in
204 the PEFCR together with its DQR values.

205 If the default dataset to be used for the process is not listed in the PEFCR, the applicant of the PEFCR shall
206 take the DQR values from the original dataset.

207

208 # 5.6 Which datasets to use?

209 The secondary datasets to be used by the applicant are those listed in this PEFCR. Whenever a dataset
210 needed to calculate the PEF-profile is not among those listed in this PEFCR, then the applicant shall choose
211 between the following options (in hierarchical order):

212   ●   Use an EF-compliant dataset available on one of the following nodes:
213   ○   http://eplca.jrc.ec.europa.eu/EF-node
214   ○   http://lcdn.blonkconsultants.nl
215   ○   http://ecoinvent.lca-data.com
216   ○   http://lcdn-cepe.org
217   ○   https://lcdn.quantis-software.com/PEF/
218   ○   http://lcdn.thinkstep.com/Node
219   ●   Use an EF-compliant dataset available in a free or commercial source;
220   ●   Use another EF-compliant dataset considered to be a good proxy. In such case this
221 information shall be included in the "limitation" section of the PEF report.
222   ●   Use an ILCD-entry level-compliant dataset. In such case this information shall be included
223 in the "data gap" section of the PEF report.
224

5.7 How to calculate the average DQR of the study

In order to calculate the average DQR of the EF study, the applicant shall calculate separately the TeR, TiR, GR and P for the EF study as the weighted average of all most relevant processes, based on their relative environmental contribution to the total single score (excluding the 3 toxicity-related ones). The calculation rules explained in chapter 5.4 shall be used.

5.8 Allocation rules

As there are no identified cases of co-products in the batteries manufacturing processes, no specific guidance is provided for allocation rules. However, in case co-products should be associated with the main battery manufacturing process, the following PEF multi-functionality decision default hierarchy shall be applied for resolving all multi-functionality problems:

(1) subdivision or system expansion;
(2) allocation based on a relevant underlying physical relationship (substitution may apply here);
(3) allocation based on some other relationship.

5.9 Electricity modelling

The guidelines in this section shall only be used for the processes where company-specific information is collected (situation 1 / Option 1 & 2 / Option 1 of the DNM).

The following electricity mix shall be used in hierarchical order:

    (i) Supplier-specific electricity product shall be used if:
          (a) available, and
          (b) the set of minimum criteria to ensure the contractual instruments are reliable is met.
    (ii) The supplier-specific total electricity mix shall be used if:
          (a) available, and
          (b) the set of minimum criteria that to ensure the contractual instruments are reliable is met.
    (iii) As a last option the 'country-specific residual grid mix, consumption mix' shall be used (available at http://lcdn.thinkstep.com/Node/). Country-specific means the country in which the life cycle stage occurs. This may be an EU country or non-EU country. The residual grid mix characterizes the unclaimed, untracked or publicly shared electricity. This prevents double counting with the use of supplier-specific electricity mixes in (i) and (ii).

Note: if for a country, there is a 100% tracking system in place, case (i) shall be applied.

259   Note: for the use stage, the consumption grid mix shall be used.

260   The environmental integrity of the use of supplier-specific electricity mix depends on ensuring that
261   contractual instruments (for tracking) **reliably and uniquely convey claims to consumers**. Without this, the
262   PEF lacks the accuracy and consistency necessary to drive product/corporate electricity procurement
263   decisions and accurate consumer (buyer of electricity) claims. Therefore, a set of minimum criteria that
264   relate to the integrity of the contractual instruments as reliable conveyers of environmental footprint
265   information has been identified. They represent the minimum features necessary to use supplier-specific
266   mix within PEF studies.

267   <u>Set of minimal criteria to ensure contractual instruments from suppliers:</u>

268   A supplier-specific electricity product/mix may only be used when the applicant ensures that any
269   contractual instrument meets the criteria specified below. If contractual instruments do not meet the
270   criteria, then 'country-specific residual grid mix, consumption mix' shall be used in the modelling.

271   A contractual instrument used for electricity modelling shall:

272   1. Convey attributes:

273   ●   Convey the energy type mix associated with the unit of electricity produced.
274   ●   The energy type mix shall be calculated based on delivered electricity, incorporating certificates
275   sourced and retired on behalf of its customers. Electricity from facilities for which the attributes
276   have been sold off (via contracts or certificates) shall be characterized as having the environmental
277   attributes of the country residual consumption mix where the facility is located.
278   2. Be a unique claim:

279   ●   Be the only instruments that carry the environmental attribute claim associated with that quantity
280   of electricity generated.
281   ●   Be tracked and redeemed, retired, or cancelled by or on behalf of the company (e.g. by an audit of
282   contracts, third-party certification, or may be handled automatically through other disclosure
283   registries, systems, or mechanisms).
284   3. Be as close as possible to the period to which the contractual instrument is applied.

285   <u>Modelling 'country-specific residual grid mix, consumption mix':</u>

286   Datasets for residual grid mix, per energy type, per country and per voltage have been purchased by the
287   European Commission and are available in the dedicated node (http://lcdn.thinkstep.com/Node/). In case
288   the necessary dataset is not available, an alternative dataset shall be chosen according to the procedure
289   described in section B.5.8. If no dataset is available, the following approach may be used:

290   Determine the country consumption mix (e.g. X% of MWh produced with hydro energy, Y% of MWh
291   produced with coal power plant) and combined them with LCI datasets per energy type and country/region
292   (e.g. LCI dataset for the production of 1MWh hydro energy in Switzerland):

293 ● Activity data related to non-EU country consumption mix per detailed energy type shall be
294   determined based on:
295

296   o Domestic production mix per production technologies
297   o Import quantity and from which neighbouring countries
298   o Transmission losses
299   o Distribution losses
300   o Type of fuel supply (share of resources used, by import and / or domestic supply)
301   These data may be found in the publications of the International Energy Agency (IEA).

302 ● Available LCI datasets per fuel technologies in the node. The LCI datasets available are generally
303   specific to a country or a region in terms of:

304   o Fuel supply (share of resources used, by import and / or domestic supply),
305   o Energy carrier properties (e.g. element and energy contents)
306   o Technology standards of power plants regarding efficiency, firing technology, flue-
307   gas desulphurisation, NOx removal and de-dusting.
308 Allocation rules:

309 Allocation may be needed: (i) to subdivide the electricity consumption among multiple products for each
310 process and (ii) to reflect the ratios of production/ratios of sales between EU countries/regions when a
311 product is produced in different locations or sold in different countries. Where such data are not available,
312 the average EU mix (EU-28 +EFTA), or region representative mix, shall be used. The following allocation
313 rules shall be used:

314   **Table 19: Allocation rules for electricity.**

Process	Physical relationship	Modelling instructions
Battery manufacturing	Mass (Kg of battery)	The allocation of energy shall be based for the manufacturing plant on the total kg of battery produced, on a yearly base.
Battery usage	Total kWh during usage (kWh)	In case of specific country electricity usage, an allocation shall be made based on the total kWh of energy used per country, based the ratio of batteries sold per country (expressed in kg) , and the total energy used per kg of battery

315

316 If the consumed electricity comes from more than one electricity mix, each mix source shall be used in
317 terms of its proportion in the total kWh consumed. For example, if a fraction of this total kWh consumed is
318 coming from a specific supplier a supplier-specific electricity mix shall be used for this part. See below for
319 on-site electricity use.

320   A specific electricity type may be allocated to one specific product in the following conditions:

321   a.   The production (and related electricity consumption) of a product occurs in a separate site
322   (building), the energy type physical related to this separated site may be used.
323   b.   The production (and related electricity consumption) of a product occurs in a shared space with
324   specific energy metering or purchase records or electricity bills, the product specific information
325   (measure, record, bill) may be used.
326   c.   All the products produced in the specific plant are supplied with a public available PEF study. The
327   company who wants to make the claim shall make all PEF studies available. The allocation rule
328   applied shall be described in the PEF study, consistently applied in all PEF studies connected to the
329   site and verified. An example is the 100% allocation of a greener electricity mix to a specific
330   product.
331
332   <u>On-site electricity generation:</u>

333   If on-site electricity production is equal to the site own consumption, two situations apply:
334   ○   No contractual instruments have been sold to a third party: the own electricity mix (combined with
335   LCI datasets) shall be modelled.
336   ○   Contractual instruments have been sold to a third party: the 'country-specific residual grid mix,
337   consumption mix' (combined with LCI datasets) shall be used.
338
339   If electricity is produced in excess of the amount consumed on-site within the defined system boundary
340   and is sold to, for example, the electricity grid, this system can be seen as a multifunctional situation. The
341   system will provide two functions (e.g. product + electricity) and the following rules shall be followed:
342   ○   If possible, apply subdivision.
343   ○   Subdivision applies both to separate electricity productions or to a common electricity production
344   where you can allocate based on electricity amounts the upstream and direct emissions to your own
345   consumption and to the share you sell out of your company (e.g. if a company has a wind mill on its
346   production site and export 30% of the produced electricity, emissions related to 70% of produced
347   electricity should be accounted in the PEF study.
348   ○   If not possible, direct substitution shall be used. The country-specific residual consumption electricity
349   mix shall be used as substitution[13].
350   ○   Subdivision is considered as not possible when upstream impacts or direct emissions are closely
351   related to the product itself.

5.10 Climate change modelling

353   The impact category 'climate change' shall be modelled considering three sub-categories:

---

[13] For some countries, this option is a best case rather than a worst case.

354 1. Climate change – fossil: This sub-category includes emissions from peat and calcination/carbonation of limestone. The emission flows ending with '(fossil)' (e.g., 'carbon dioxide (fossil)'' and 'methane (fossil)') shall be used if available.

357 2. Climate change – biogenic: This sub-category covers carbon emissions to air (CO_2, CO and CH_4) originating from the oxidation and/or reduction of biomass by means of its transformation or degradation (e.g. combustion, digestion, composting, landfilling) and CO_2 uptake from the atmosphere through photosynthesis during biomass growth – i.e. corresponding to the carbon content of products, biofuels or aboveground plant residues such as litter and dead wood. Carbon exchanges from native forests[14] shall be modelled under sub-category 3 (incl. connected soil emissions, derived products, residues). The emission flows ending with '(biogenic)' shall be used.

364 A simplified modelling approach shall be used when modelling the foreground emissions: Only the emission 'methane (biogenic)' is modelled, while no further biogenic emissions and uptakes from atmosphere are included. When methane emissions can be fossil or biogenic, the release of biogenic methane shall be modelled first and then the remaining fossil methane.

368 As the product life cycle or part of the life cycle is never expected to have a carbon storage beyond 100 years, credits from biogenic carbon storage shall not be modelled.

370 3. Climate change – land use and land transformation: This sub-category accounts for carbon uptakes and emissions (CO_2, CO and CH_4) originating from carbon stock changes caused by land use change and land use. This sub-category includes biogenic carbon exchanges from deforestation, road construction or other soil activities (incl. soil carbon emissions). For native forests, all related CO_2 emissions are included and modelled under this sub-category (including connected soil emissions, products derived from native forest[15] and residues), while their CO_2 uptake is excluded. The emission flows ending with '(land use change)' shall be used.

377 For land use change, all carbon emissions and removals shall be modelled following the modelling guidelines of PAS 2050:2011 (BSI 2011) and the supplementary document PAS2050-1:2012 (BSI 2012) for horticultural products. PAS 2050:2011 (BSI 2011): Large emissions of GHGs can result as a consequence of land use change. Removals as a direct result of land use change (and not as a result of long-term management practices) do not usually occur, although it is recognized that this could happen in specific circumstances. Examples of direct land use change are the conversion of land used for growing crops to industrial use or conversion from forestland to cropland. All forms of land use change that result in emissions or removals are to be included. Indirect land use change refers to such conversions of land use as a consequence of changes in land use elsewhere. While GHG emissions also arise from indirect land use change, the methods and data requirements for calculating these emissions are not fully developed. Therefore, the assessment of emissions arising from indirect land use change is not included.

---

[14] Native forests – represents native or long-term, non-degraded forests. Definition adapted from table 8 in Annex V C(2010)3751 to Directive 2009/28/EC.

[15] Following the instantaneous oxidation approach in IPCC 2013 (Chapter 2).

389	The GHG emissions and removals arising from direct land use change shall be assessed for any input to
390	the life cycle of a product originating from that land and shall be included in the assessment of GHG
391	emissions. The emissions arising from the product shall be assessed on the basis of the default land use
392	change values provided in PAS 2050:2011 Annex C, unless better data is available. For countries and
393	land use changes not included in this annex, the emissions arising from the product shall be assessed
394	using the included GHG emissions and removals occurring as a result of direct land use change in
395	accordance with the relevant sections of the IPCC (2006). The assessment of the impact of land use
396	change shall include all direct land use change occurring not more than 20 years, or a single harvest
397	period, prior to undertaking the assessment (whichever is the longer). The total GHG emissions and
398	removals arising from direct land use change over the period shall be included in the quantification of
399	GHG emissions of products arising from this land on the basis of equal allocation to each year of the
400	period.

401	1) Where it can be demonstrated that the land use change occurred more than 20 years prior to
402	the assessment being carried out, no emissions from land use change should be included in the
403	assessment.

404	2) Where the timing of land use change cannot be demonstrated to be more than 20 years, or a
405	single harvest period, prior to making the assessment (whichever is the longer), it shall be assumed
406	that the land use change occurred on the 1st January of either:

407	○ the earliest year in which it can be demonstrated that the land use change had occurred; or
408	○ or the year in which the assessment of GHG emissions and removals is being carried out.
409	The following hierarchy shall apply when determining the GHG emissions and removals arising
410	from land use change occurring not more than 20 years or a single harvest period, prior to making
411	the assessment (whichever is the longer):

412	1. where the country of production is known and the previous land use is known, the GHG
413	emissions and removals arising from land use change shall be those resulting from the
414	change in land use from the previous land use to the current land use in that country
415	(additional guidelines on the calculations can be found in PAS 2050-1:2012);
416	2. where the country of production is known, but the former land use is not known, the GHG
417	emissions arising from land use change shall be the estimate of average emissions from the
418	land use change for that crop in that country (additional guidelines on the calculations can
419	be found in PAS 2050-1:2012);
420	3. where neither the country of production nor the former land use is known, the GHG
421	emissions arising from land use change shall be the weighted average of the average land
422	use change emissions of that commodity in the countries in which it is grown.
423	Knowledge of the prior land use can be demonstrated using a number of sources of information,
424	such as satellite imagery and land survey data. Where records are not available, local knowledge of
425	prior land use can be used. Countries in which a crop is grown can be determined from import
426	statistics, and a cut-off threshold of not less than 90% of the weight of imports may be applied.

427 Data sources, location and timing of land use change associated with inputs to products shall be
428 reported.

429 Soil carbon storage shall not be modelled, calculated and reported as additional environmental
430 information.

431 The sum of the three sub-categories shall be reported.

432 The sub-category 'Climate change-biogenic' shall be reported separately.

433 The sub-category 'Climate change-land use and land transformation' shall be reported separately.

5.11 Modelling of waste and recycled content

435 The waste of products used during the manufacturing, distribution, retail, the use stage or after use shall
436 be included in the overall modelling of the life cycle of the organisation. Overall, this should be modelled
437 and reported at the life cycle stage where the waste occurs. This section gives guidelines on how to model
438 the End-of-Life of products as well as the recycled content.

439 The Circular Footprint Formula is used to model the End-of-Life of products as well as the recycled content
440 and is a combination of "material + energy + disposal", i.e.:

441 **Material**

442
$$(1 - R_1)E_V + R_1 \times \left(AE_{recycled} + (1 - A)E_V \times \frac{Q_{Sin}}{Q_p}\right) + (1 - A)R_2 \times \left(E_{recyclingEoL} - E_V^* \times \frac{Q_{Sout}}{Q_P}\right)$$

443 **Energy** $(1 - B)R_3 \times \left(E_{ER} - LHV \times X_{ER,heat} \times E_{SE,heat} - LHV \times X_{ER,elec} \times E_{SE,elec}\right)$

444 **Disposal** $(1 - R_2 - R_3) \times E_D$

445

446 With the following parameters:

447 **A:** allocation factor of burdens and credits between supplier and user of recycled materials.

448 **B:** allocation factor of energy recovery processes: it applies both to burdens and credits. It shall be set to
449 zero for all PEF studies.

450 **Qs_{in}:** quality of the ingoing secondary material, i.e. the quality of the recycled material at the point of
451 substitution.

452 **Qs_{out}:** quality of the outgoing secondary material, i.e. the quality of the recyclable material at the point of
453 substitution.

454 **Q_p:** quality of the primary material, i.e. quality of the virgin material.

455 **R₁:** it is the proportion of material in the input to the production that has been recycled from a previous
456 system.

457 **R₂:** it is the proportion of the material in the product that will be recycled (or reused) in a subsequent
458 system. R2 shall therefore take into account the inefficiencies in the collection and recycling (or reuse)
459 processes. R2 shall be measured at the output of the recycling plant.

460 **R₃:** it is the proportion of the material in the product that is used for energy recovery at EoL.

461 **E$_{recycled}$ (E$_{rec}$):** specific emissions and resources consumed (per functional unit) arising from the recycling
462 process of the recycled (reused) material, including collection, sorting and transportation process.

463 **E$_{recyclingEoL}$ (E$_{recEoL}$):** specific emissions and resources consumed (per functional unit) arising from the
464 recycling process at EoL, including collection, sorting and transportation process.

465 **E$_v$:** specific emissions and resources consumed (per functional unit) arising from the acquisition and pre-
466 processing of virgin material.

467 **E*$_v$:** specific emissions and resources consumed (per functional unit) arising from the acquisition and pre-
468 processing of virgin material assumed to be substituted by recyclable materials.

469 **EER:** specific emissions and resources consumed (per functional unit) arising from the energy recovery
470 process (e.g. incineration with energy recovery, landfill with energy recovery, …).

471 **E$_{SE,heat}$ and E$_{SE,elec}$:** specific emissions and resources consumed (per functional unit) that would have arisen
472 from the specific substituted energy source, heat and electricity respectively.

473 **ED:** specific emissions and resources consumed (per functional unit) arising from disposal of waste material
474 at the EoL of the analysed product, without energy recovery.

475 **X$_{ER,heat}$ and X$_{ER,elec}$:** the efficiency of the energy recovery process for both heat and electricity.

476 **LHV:** Lower Heating Value of the material in the product that is used for energy recovery.

477 The reference scenario and the relevant parameters for this PEFCR are described in paragraph 6.6.

478

479

480

481 6 Life cycle stages

482 6.1 Raw material acquisition and pre-processing

483 Below is provided the list of all processes taking place in this life cycle stage (transport in separate table),
484 and the default values used for the representative products. As the parameter R1 (see recycled content
485 paragraph 6.6) is set as 0 per default, it is not mentioned in this table.

486 **Table 20: Raw material acquisition and processing**

488 The applicant shall report the DQR values (for each criterion + total) for all the datasets used.

489 Reminder: the applicant shall decide the situation according parag 5.1 (case 1 or case 2) . The
490 corresponding processes, expected to be run by the company, shall be calculated with primary data.

491 The global transport data are not a relevant impact, they are provided in the paragraph 6.4, including both
492 raw material transport and distribution phase.

493 Modelling the recycled content is not applicable in this PEFCR.

6.2 (reserved)

6.3 Manufacturing

496 The manufacturing process shall include all steps as described in the system boundaries (see paragraph 3.4)

497 Below is provided the list of the materials to be taken onto account for the manufacturing stage, and the
498 default values used for the representative products. Defaults in the table shall be used where the use of
499 secondary data is allowed according to 5.1.

504

505   Reminder: the applicant shall decide the situation according parag 5.1 (case 1 or case 2) . The
506   corresponding processes, expected to be run by the company, shall be calculated with primary data.

507   The applicant shall report the DQR values (for each criterion + total) for all the datasets used.

508   The waste of products used during the manufacturing shall be included in the modelling. By default, direct
509   wastes from manufacturing shall be included based on an increase of 5% of the cell mass components
510   amounts and 3% increase for passive components, unless correctly measured and identified in the bill of
511   material. In addition, the emissions of the electrode manufacturing process have to be included, as
512   indicated above. Auxiliary manufacturing flows, such as auxiliary solvents, shall be taken into account.
513   These may be only partially recycled depending on each plant. Energy requirements shall also be taken into
514   account.

6.4 Distribution stage

516   In general transportation has a negligible impact on the environment in the life cycle of a rechargeable
517   battery /SCREENING 2015/.

518   The transport from factory to final client (including consumer transport) shall be modelled within this life
519   cycle stage. The final client is defined as the user (use phase).

520   In case supply-chain-specific information is available for one or several transport parameters, they may be
521   applied following the Data Needs Matrix.

522   For the battery PEF profiles the following scenario shall be used, including all phases of transport in the
523   product life, except if a specific detailed assessment can be documented. In case supply-chain-specific
524   information is available for one or several transport parameters, they may be applied following the Data
525   Needs Matrix.

526 (Note: air transport is not considered in the reference case. In case of air transport, the activity data shall
527 be assessed accordingly).

528   a-   Nonspecific transport conditions (according PEF guidance 6.3)

529 From component supplier to OEM factory:transport in Europe (utilisation ratio 64%)

530   • 130 km by truck (28-32 t, EURO 5; 28-32 t, EURO 5; UUID 0aa65e8b-70c8-4b7f-b1d7-91a6403d2b5a), PEFCR
531   specific utilisation ratio; and

532   • 240 km by train (average freight train; UUID 02e87631-6d70-48ce-affd-1975dc36f5be); and

533   • 270 km by ship (barge; UUID 4cfacea0-cce4-4b4d-bd2b-223c8d4c90ae).

534 From OEM factory to user (Use Phase): (utilisation ratio 64%) intracontinental supply chain: 200 km by truck (28-
535 32 t, EURO 5; UUID 0aa65e8b-70c8-4b7f-b1d7-91a6403d2b5a) (Eurostat 2014),

536

537 Transport to the EoL recycling: (utilisation ratio 64%) intracontinental supply chain: 200 km by truck (28-32 t,
538 EURO 5; UUID 0aa65e8b-70c8-4b7f-b1d7-91a6403d2b5a) (Eurostat 2014),

539

540   b-   Batteries specific conditions (utilisation ratio 64%) :

541   • Active material: transport from China to Korea 300 km by truck, 200km by rail and 10000 km by ship

542   • Passive material: transport 300 km in Japan by truck, 200 km by rail and 18000 km by ship

543   • Cell: transport from Japan, Korea or China to Europe => transport 300 km by truck, 200 km by rail and 18000
544   km by ship

545   • The storage of the batteries at different stages of their life cycle is not specified (also not specific conditions
546   or requirements such as temperature control).

547

549

550 The applicant shall report the DQR values (for each criterion + total) for all the datasets used.

551 By default, there is no waste of products during the distribution and retail stage.

6.5 Use stage

553 The use stage of the battery is defined by the energy losses due to the battery and charger efficiency. The
554 mobile application manufacturer has to consider in its PEF profile the total energy consumption during the
555 life cycle of its product.

556 The use stage scenarios are defined by:

557 - Energy losses due to battery and charger efficiency over battery life time
558 - Country specific energy mix

559 Explanation:

560 For electricity consumed during the use stage of products, the energy mix shall reflect ratios of sales
561 between countries or regions. Where such data are not available, the average EU consumption mix, or
562 otherwise most representative mix, shall be used.

563 The energy losses (activity data) of the specific battery system shall be indicated by the PEFCR user. They
564 shall include the losses at the charge (as provided by the charger supplier) and the losses at the battery.

565 The following formula for the batteries may be used to calculate the losses, or in absence of technical
566 information, the default data provided below per battery chemistry.

567 $$Energy\ efficiency = \left(\frac{V_p}{V_c}\right)\left(\frac{I_p T_p}{I_c T_c}\right) = (voltage\ efficiency)(\textbf{coulumb}\ efficiency)$$

568 V, I, and T are respectively Voltage, Current and Time for Charge and Discharge.

569 *Losses= (1 - Energy efficiency)(Application Service energy)*

570 Characteristics of different technologies:

571 • Ni- Cd and Ni-MH have a similar behaviour: coulomb eff. 85% and voltage efficiency:
572 (1,23V)/(1,38V) = 89%, energy eff. = 76% [16]

---

[16] Saft Ni-Cd technical leaflets: SPH range, Uptimax range (www.saftbatteries.com)

573 • Li-ion have a coulomb efficiency close to 100% (no side reaction when charged up to 100%), and
574 voltage efficiency (3,6V)/(3,75V) =96%, leading to an energy efficiency = 96%[17]
575 • In addition to the battery energy efficiency, the charger efficiency is taken into account according
576 the specification provided by the charger manufacturer. Typical data re provided as default data.
577

578 Concerning the use stage, the following table shall be used to provide the correct Application Service
579 energy (quantity of Functional Units) according the user knowledge about the battery performance and
580 the application requirements. In this table, "knowledge" refers to the understanding and availability of
581 information concerning the battery usage during the use stage. "Global knowledge" means the knowledge
582 of the battery life duration in the usage conditions (charging and discharging temperature and rate
583 conditions, representative cycle with state of charge variations, number of cycles), and the knowledge of
584 the application (number of batteries used per equipment or vehicle during its life).

585 **Table 24: Guideline for calculation of quantity of Functional Units and Reference flow**

Use phase situation knowledge	Application	Battery	Number of batteries per application	Reference flow (Rf)
1 global knowledge	application service (AS=Total Wh need) known	Total Wh in application known (QuA)	Known or calculated Nb= AS/QuA	Rf= Nb*mass/AS
2 battery knowledge only	Unknown	Total Wh in application known (QuA)	unknown	Rf= mass/QuA
3 Application knowledge only	application service (AS=Total Wh need) known	Nb batteries needed is known		Rf= Nb batt*mass/AS
4 lack of knowledge	Un known	Total Wh in application Unknown, but life cycle at 100% DOD according the std known: Apply QuA= Wh per cycle* Nbcycles* 80%		Rf= mass/QuA
5 no knowledge	Un known	Battery life unknown. Apply QuA=Wh per cycle*400*80%		Rf= mass/QuA

586

587 Concerning the number of cycles of the battery over life, the applicant should to use the battery
588 manufacturer data proving the life span of the battery in the application (it can be a specific life cycle
589 testing, or a measurement of the battery life in the application). In case no data is available, the applicant
590 shall use the value of cycles measured according the IEC standards. In all cases, the reference of the
591 selected information source shall be provided in the PEF report.

---

[17] Saft Li-ion technical leaflet: Evolion system(www.saftbatteries.com)

592

Table 25: Use stage.

Material/ Process	PEFCR Geographical reference	Unit (output)	Power tool	ICT		e-mobility	EF compliant dataset used	EF Geographical reference	Dataset source	UUID	Default DQR (estimated)

Power	EU-27	kWh/kg battery	6.9	11.7	11.6	9.6	Electricity grid mix	EU-28+EFTA	PEF DB	{34960d4d-af62-43a0-aa76-adc5fcf57246}	2	1	1	1	1

594

595 The applicant shall report the DQR values (for each criterion + total) for all the datasets used.

596 For the use stage the consumption grid mix shall be used. The electricity mix shall reflect the ratios of sales
597 between EU countries/regions. To determine the ratio a physical unit shall be used (kg of product). Where
598 such data are not available, the average EU consumption mix (EU-28 +EFTA), or region representative
599 consumption mix, shall be used (see parag. 5.9.)

600 There are no waste of products during the use stage of the batteries in the scope of this PEFCR.

6.6 End of life

602 The End-of-Life stage is a life cycle stage that in general includes the waste of the product in scope, such as
603 the food waste, primary packaging, or the product left at its end of use.

604 For the batteries, all the processes for collection and recycling are described (see parag 3.4- boundaries for
605 End of Life stage).

606 Below is provided the list of all processes taking place in this life cycle stage (transport in separate table),
607 and the default values that shall be used in absence of primary data (see also annex 4).

608

609

610 The applicant shall report the DQR for all the datasets used for the most relevant processes, the new ones
611 created.

612 The electricity mix shall be adapted to the country (countries) specific conditions of the end-of-life stage

613 The end of life shall be modelled using the formula and guidance provided in chapter 'End of life modelling'
614 of this PEFCR together with the default parameters listed in the Table 27.

615 Before selecting the appropriate R_2 value, an evaluation for recyclability of the material shall be done and
616 the PEF study shall include a statement on the recyclability of the materials/products. The statement on
617 the recyclability shall be provided together with an evaluation for recyclability that includes evidence for
618 the following three criteria (as described by ISO 14021:1999, section 7.7.4 'Evaluation methodology'):

619 1. The collection, sorting and delivery systems to transfer the materials from the source to the
620   recycling facility are conveniently available to a reasonable proportion of the purchasers, potential
621   purchasers and users of the product;
622 2. The recycling facilities are available to accommodate the collected materials;
623 3. Evidence is available that the product for which recyclability is claimed is being collected and
624   recycled.

625 Point 1 and 3 can be proven by recycling statistics (country specific) derived from industry associations or
626 national bodies. Approximation to evidence at point 3 can be provided by applying for example the design
627 for recyclability evaluation outlined in EN 13430 Material recycling (Annexes A and B) or other sector-
628 specific recyclability guidelines if available.

629 Following the evaluation for recyclability, the appropriate R_2 values (supply-chain specific or default) shall
630 be used. If one criterion is not fulfilled or the sector-specific recyclability guidelines indicate a limited
631 recyclability an R_2 value of 0% shall be applied.

632 Company-specific R_2 values (measured at the output of the recycling plant) shall be used when available. If
633 no company-specific values are available and the criteria for evaluation of recyclability are fulfilled (see
634 below), application-specific R_2 values shall be used as listed in the table below,
635   ● If an R_2 value is not available for a specific country, then the European average shall be used.

636   ● If an R_2 value is not available for a specific application, the R_2 values of the material shall be used
637   (e.g. materials average).
638   ● In case no R_2 values are available, R_2 shall be set equal to 0 or new statistics may be generated in
639   order to assign an R_2 value in the specific situation.
640 The applied R_2 values shall be subject to the PEF study verification

641 The following End-of-Life scenario shall be used, except when the PEFCR user can document that specific
642 values for collection and recycling are applied to the battery under study. The reference values are
643 applicable for Europe.

644

645 <center>**Table 27: EoL Scenario in EU to be applied in the PEF declaration**</center>

Waste treatment	CPT+ICT	e-mobility
Collection for recycling	45%	95%
Unidentified stream	30%	5%
Landfill	16%	-
Incineration	9%	-

646 Applying the CFF formula for batteries in the scope of this PEFCR, the following values of the parameters
647 shall be used:

648 Parameter A=0.2 for metals and 0.5 for plastics.

649 Parameter B=0.

650 Parameter R1=0, as no battery specific data is available for the recycling content.

651 The parameter R2 is corresponding to the Table 27 (Collection for recycling)and refer to the whole product.
652 The conversion to the recycling output rate (R2) for the different materials is included in the EF -compliant
653 dataset. A value for the different materials applies (see Annex 4).

654 The quality ratio Qsout/Qp associated to the recycled content is equal to 1, as mainly metals are recycled.
655 Applying a conservative approach, the landfill scenario is applied by default to the part of batteries
656 considered as "unidentified".

657 Packaging is not considered in the batteries PEF.

658 In case no primary data for the activity data of the recycling process of the battery system is available, the
659 activity data provided by default in table 25 shall be used.

7 PEF results

7.1 Benchmark values

It is not possible to anticipate all potential uses of the benchmark due to the large number of products and applications. Uses can range from benchmarking two similar products competing for direct substitution in the same Original Equipment Manufacturer (OEM) product to comparing different battery technologies in different OEM products.

For reference, the environmental impacts calculated for the representative products are listed in the table below:

Table 28: Characterised benchmark values for the 4 representative products

685

686

687

7.2 PEF profile

The applicant shall calculate the PEF profile of its product in compliance with all requirements included in this PEFCR. The following information shall be included in the PEF report:

- full life cycle inventory;
- characterised results in absolute values, for all impact categories (including toxicity; as a table);
- normalised and weighted result in absolute values, for all impact categories (including toxicity; as a table);
- the aggregated single score in absolute values

Together with the PEF report, the applicant shall develop an aggregated EF-compliant dataset of its product in scope. This dataset shall be made available on the EF node (http://eplca.jrc.ec.europa.eu/EF-node). The disaggregated version may stay confidential.

699

7.3 Additional technical information

701

No additional technical information is required in this PEFCR.

703

7.4 Additional environmental information

Concerning the impact on biodiversity, as this may also arise from site-based practices rather than material flows, it may be possible to indicate under Additional Environmental Information if a material risk of biodiversity impacts resulting from site-based practices is identified. The supporting studies have not indicated significant possible impacts (i.e. limited land use), therefore this impact is not at the moment of concern.

710

711

712

8 Verification

714 The verification of an EF study/report carried out in compliance with this PEFCR shall be done according to
715 all the general requirements included in Section 8 of the PEFCR Guidance 6.3 and the requirements listed
716 below.
717 The verifier(s) shall verify that the EF study is conducted in compliance with this PEFCR.
718 These requirements will remain valid until an EF verification scheme is adopted at European level or
719 alternative verification approaches applicable to EF studies/report are included in existing or new policies.
720
721 The verifier(s) shall validate the accuracy and reliability of the quantitative information used in the
722 calculation of the study. As this can be highly resource intensive, the following requirements shall be
723 followed:

724 • the verifier shall check if the correct version of all impact assessment methods was used. For each
725 of the most relevant impact categories, at least 50% of the characterisation factors (for each of the
726 most relevant EF impact categories) shall be verified, while all normalisation and weighting factors
727 of all ICs shall be verified. In particular, the verifier shall check that the characterisation factors
728 correspond to those included in the EF impact assessment method the study declares compliance
729 with[18];

730 • all the newly created datasets shall be checked on their EF compliancy (for the meaning of EF
731 compliant datasets refer to Annex H of the Guidance). All their underlying data (elementary flows,
732 activity data and sub processes) shall be validated;

733 • the aggregated EF-compliant dataset of the product in scope (meaning, the EF study) is available on
734 the EF node (http://eplca.jrc.ec.europa.eu/EF-node).

735 • for at least 70% of the most relevant processes in situation 2 option 2 of the DNM, 70% of the
736 underlying data shall be validated. The 70% data shall including all energy and transport sub
737 processes for those in situation 2 option 2;

738 • for at least 60% of the most relevant processes in situation 3 of the DNM, 60% of the underlying
739 data shall be validated;

740 • for at least 50% of the other processes in situation 1, 2 and 3 of the DNM, 50% of the underlying
741 data shall be validated.

742
743 In particular, it shall be verified for the selected processes if the DQR of the process satisfies the minimum
744 DQR as specified in the DNM.

745 The selection of the processes to be verified for each situation shall be done ordering them from the most
746 contributing to the less contributing one and selecting those contributing up to the identified percentage
747 starting from the most contributing ones. In case of non-integer numbers, the rounding shall be made
748 always considering the next upper integer.

---

[18] Available at: http://eplca.jrc.ec.europa.eu/LCDN/developer.xhtml

749 These data checks shall include, but should not be limited to, the activity data used, the selection of
750 secondary sub-processes, the selection of the direct elementary flows and the CFF parameters. For
751 example, if there are 5 processes and each one of them includes 5 activity data, 5 secondary datasets and
752 10 CFF parameters, then the verifier(s) has to check at least 4 out of 5 processes (70%) and, for each
753 process, (s)he shall check at least 4 activity data (70% of the total amount of activity data), 4 secondary
754 datasets (70% of the total amount of secondary datasets), and 7 CFF parameters (70% of the total amount
755 of CFF parameters), i.e. the 70% of each of data that could be possible subject of check.

756 The verification of the EF report shall be carried out by randomly checking enough information to provide
757 reasonable assurance that the EF report fulfils all the conditions listed in section 8 of the PEFCR Guidance.

758

ANNEX 1 – List of EF normalisation and weighting factors

770
771

Global normalisation factors are applied within the EF. The normalisation factors as the global impact per person are used in the EF calculations.

Impact category	Unit	Normalisation factor	Normalisation factor per person	Impact assessment robustness	Inventory coverage completeness	Inventory robustness	Comment
Climate change	kg CO_2 eq	5.35E+13	7.76E+03	I	II	I	
Ozone depletion	kg CFC-11 eq	1.61E+08	2.34E-02	I	III	II	
Human toxicity, cancer	CTUh	2.66E+05	3.85E-05	II/III	III	III	
Human toxicity, non-cancer	CTUh	3.27E+06	4.75E-04	II/III	III	III	
Particulate matter	disease incidence	4.39E+06	6.37E-04	I	I/II	I /II	NF calculation takes into account the emission height both in the emission inventory and in the impact assessment.
Ionising radiation, human health	kBq U^{235} eq	2.91E+13	4.22E+03	II	II	III	
Photochemical ozone formation, human health	kg NMVOC eq	2.80E+11	4.06E+01	II	III	I/II	
Acidification	mol H+ eq	3.83E+11	5.55E+01	II	II	I/II	
Eutrophication, terrestrial	mol N eq	1.22E+12	1.77E+02	II	II	I/II	
Eutrophication, freshwater	kg P eq	1.76E+10	2.55E+00	II	II	III	
Eutrophication, marine	kg N eq	1.95E+11	2.83E+01	II	II	II/III	
Land use	pt	9.20E+15	1.33E+06	III	II	I I	The NF is built by means of regionalised CFs.

Ecotoxicity, freshwater	CTUe	8.15E+13	1.18E+04	II/III	III	III	
Water use	m³ world eq	7.91E+13	1.15E+04	III	I	II	The NF is built by means of regionalised CFs.
Resource use, fossils	MJ	4.50E+14	6.53E+04	III			
Resource use, minerals and metals	kg Sb eq	3.99E+08	5.79E-02	III	I	II	

774

Weighting factors for Environmental Footprint

	Aggregated weighting set	Robustness factors	Calculation	Final weighting factors
	(50:50)	(scale 1-0.1)		
WITHOUT TOX CATEGORIES	A	B	C=A*B	C scaled to 100
Climate change	15.75	0.87	13.65	**22.19**
Ozone depletion	6.92	0.6	4.15	**6.75**
Particulate matter	6.77	0.87	5.87	**9.54**
Ionizing radiation, human health	7.07	0.47	3.3	**5.37**
Photochemical ozone formation, human health	5.88	0.53	3.14	**5.1**
Acidification	6.13	0.67	4.08	**6.64**

ANNEX 2 - check-list for the PEF study

784   Each PEF study shall include this annex, completed with all the requested information.

ITEM	Included in the study (Y/N)	Section	Page
[This column shall list all the items that shall be included in PEF studies. One item per row shall be listed.]	[The PEF study shall indicate if the item is included or not in the study]	[The PEF study shall indicate in which section of the study the item is included]	[The PEF study shall indicate in which page of the study the item is included]
Summary			
General information about the product			
General information about the company			
Diagram with system boundary and indication of the situation according to DNM			
List and description of processes included in the system boundaries			
List of co-products, by-products and waste			
List of activity data used			
List of secondary datasets used			
Data gaps			
Assumptions			
Scope of the study			
(sub)category to which the product belongs, including a technical description of the battery and its application.			
DQR calculation of each dataset used for the most relevant processes and the new ones created.			
DQR (of each criteria and total) of the study

Product Environmental Footprint pilots: Batteries						
PEFCR External Panel Review						
Note: only the comments about the issues identified in the PEFCR version 6.3 (Jan 2018) have been reported						
Reviewer	0	1	2	3	4	5	6
	Comment number	reference to chapter/annex number	Paragraph/figure/table	page number	comment	proposed change	action/answer to comment
Ugo Pretato Etienne Lees-Perasso	8	3.7	general	16	Not accepted: page 23 refers to the guidance version 6.2 instead of 6.3 (in 3 places)	Refer to the new guidance v6 and implement any new requirements compared to the previous version, giving priority to those requirements potentially affecting the remodeling exercise. Same for annexes 10, 12.6 and 12.7	3 references modified
Mikko Samuli VAIJA - Orange Labs Products & Services	17		Table 4-3 and Table 8-1	21 and 64	Can't found table 12-2 or 12-3 in the document. There are two table 12 : "Allocation rules for electricity" (page 60) and "Raw material acquisition and processing " (page 66). If I update the "List of Tables" (page 6) it seems there are a lot of dead links (only Table 1, 2 and 15 are correctly displayed) In Table 2 (page 29) it's written "Pyrometallurgical process for the cell Hydrometallurgical treatment for the cell "		tables and list of table corrected and updated. Text in Table 2 clarified

Mikko Samuli VAIJA - Orange Labs Products & Services	**20**		Figure 4-3	26	Table 12 "Raw material acquisition and processing" shows indeed that the polymer mix is 50 % PVFD / 50 % SBR. But Figure 5 "Cradle to gate processes for Li-ion battery production" (page 26) is still about "Polymer" without any explanation on the compound.		Lihtium polymer is a generic name for Lithium batteries with a a soft casing (also named "pouch cells"). It does not refer to the type of polymer used. The specific materials for this soft casing is included in the representative products BoM.
Mikko Samuli VAIJA - Orange Labs Products & Services	**27**		4.5 and Table 4-5	30	The reference for the EPTA (PE) charger LCA (http://www.epta.eu/energy-a-resource-efficency/life-cycle-analysis:) is incorrect (JERROR_LAYOUT_THE_PAGE_YOU_WHERE_LOOKING_FOR). If I remove the ":" and go to : "http://www.epta.eu/energy-a-resource-efficency/life-cycle-analysis" I get an elusive web page about EPTA and LCA. With the "read more" option it's possible to download a PDF file. The only information provided by this document is that an LCA was carried out in 2008 (10 years ago...). We don't know anything about the charger's design (only that it includes a 2-layers PCB). In Chapter 4 (page 45) the charger is a key unit process for the CPT and the two Li-ion batteries for Climate Change, Resources Use energy carriers and Resources Use minerals and metals. It's quite troublesome to have an item with such high contribution and no to know anything about it's design. For example, for Resources Use minerals and metals a 2008 charger might be quite bulky, with a design that relies mostly on through-hole mounted electronic components or integrated circuits with thick wire bonding. Check if the the reference is correct and if it is possible to obtain the BoM of the charger. Otherwise consider to disclose the BoM in an annex.		Added the BoM of the charger in the annex, and explanatory comment in the parag 5.3. See also comment below about the components of the charger.

Mikko Samuli VAIJA - Orange Labs Products & Services	**44**		5.3.1	36	Consider using the terms of the PEFCR guidance for cut-of "In case processes are excluded from the model this shall be done based on a 1% cut-off for all impact categories based on environmental significance […]" if it's what is meant by "negligeable"		accepted and included
Mikko Samuli VAIJA - Orange Labs Products & Services	**61**		5.8	44	accepted if the applicable annex is Annex 4		reference to annex 4 in he relevant paragraphs.
Ugo Pretato	**78**	Annex VIII	general	64-65	There are some inconsistencies in the elementary flow collection table (§5.1, pp 48-49) - all flows under "energy & water" or "auxiliary" ar not elementary, therefore should be moved to another table or section - particles emissions shall be distinguished according to the particle size (e.g. 2.5, 10, etc.) as the characterization factors may be different		The tables for elementary flows have been modified. Concerning the particles emissions, the flows for Dust PM 2.5 and Dust PM 10 have been separated.

Mikko Samuli VAIJA - Orange Labs Products & Services	**83**		Table 12-6	70	There are several designs for TO-263 components. For example I retrieved two complete material declaration for this type of component: - Semtech's EZ1581CMTRT which weights 1435 mg and contains 1,2 mg of gold and 0,85 mg of silver - Infineon's IPB065N15N3 G which weights 1532 mg but is based on non-noble metal technology (i.e. does not contain gold, silver, palladium, platinum, etc.). Its wiring is made of aluminium and the leadframe is a copper/aluminium alloy rather than a copper/tin/silver alloy as in Semtech's product The gold and silver contained in the Semtech component are equivalent to an Abiotic Resources Depletion score of 6,34E-05 kg eq. Sb. That's more than for the Li-ion battery's entire life cycle (to be mitigated with the fact the only a fraction of the battery's SMU might be allocated for this FU) . But if one SMU is allocated to the FU then with one wrong pick on a component it's possible to change completely the outcome of the study (i.e. is the charger a key component for Abiotic Resources Depletion for ex.).		The comment is valid. The Technical secretariat has referred to publicly available information, based on realistic product for the Power tools application, using component with chemical and subsequently electrolytic gold-on-nickel finishing. There has been no specific studies to demonstrate that the components are representative for the chargers of other applications. Additive limitation will be indicated in the paragraph 5.3 for the charger. In any case the change of the reference components is only possible when the primary datafor the actual charger are available, thus eliminating the risk of wrong picking the components.
Mikko Samuli VAIJA - Orange Labs Products & Services	**96**	3.3 Functional unit and reference flow	Table 1 (or Table 3)	30	The text indicates "Table 1defines the key aspects used to define the FU." but the table about FU is Table 3. Check the tables numbering in the text as well as in the titles.		references corrected
Mikko Samuli VAIJA - Orange Labs Products & Services	**97**	3.4 System boundary	Figure 2 (or Figure 4)	33 and 34	The text indicates "Figure 2 shows a general overview of the boundaries among the whole Life Cycle of a battery system" but that's what Figure 4 is about. Check the figures numbering in the text as well as in the titles.		references corrected

Mikko Samuli VAIJA - Orange Labs Products & Services	98	6 Life cycle stages	Table 12 ; Table 13 ; Table 14 ; Table 16 and Table 17	66, 67, 68, 70 and 71	All these tables were pasted as pictures in the Word file, therefore it's impossible to copy/select the text. That's especially bothersome for UUIDs. No one wants to try to decipher these 32 characters long identifiers in order to find the model that was used. For the sake of readability consider pasting these tables as they are in Excel or create new tables directly in Word (i.e. like Annex 4).		The tables have been modified to increase readability. In addition, the tables in parag 6 are now in Excell format, allowing for a copy/paste of the content.
Etienne Lees-Perasso - Bureau Veritas CODDE	99	III. List of acronyms		8	The title must be "Acronyms"		corrected
Etienne Lees-Perasso - Bureau Veritas CODDE	100	I. Terms and definitions		10	The title must be "Definitions"		corrected
Etienne Lees-Perasso - Bureau Veritas CODDE	101	3.2	Table 2, last line	29	Correct the typo in the last line	The infrastructures have been assessed based on	corrected
Etienne Lees-Perasso - Bureau Veritas CODDE	102	3.4		33	"According to this PEFCR, the following processes may be excluded based on the cut-off rule: - Detailed transport operations description for raw materials, product distribution or end of life: as the impact has been calculated as negligible, only the default data provided shall be used. " There is an inconsistency between the first "may", then the "shall": do we must use the default data, even if we have actual primary data?	Clarify	clarification that the default data shall be used unless primary data of required quality according parag 5.4 is available.
Etienne Lees-Perasso - Bureau Veritas CODDE	103	3.4.1, 3.4.2, 3.4.3		35-38	The chapters titles are not in line with table 6. That could lead to confusion (especially for the production stage, including bothe the raw material acquisition and the main product production)	Clarify	Title parag 3.4.1 clarified

Etienne Lees-Perasso - Bureau Veritas CODDE	104	3.4.1	Last paragraph p 35	35	The reference to figure 3 is obsolete	Update the reference to figure 5	corrected
Etienne Lees-Perasso - Bureau Veritas CODDE	105	3.4.1	Last paragraph p 36	35	The reference to figure 4 is obsolete	Update the reference to figure 6	corrected
Etienne Lees-Perasso - Bureau Veritas CODDE	106	3.4.3	Last paragraph p 38	35	The reference to figure 5 is obsolete	Update the reference to figure 7	corrected
Etienne Lees-Perasso - Bureau Veritas CODDE	107	3.5		41	Even though the link is the one stated in the guidance 6.3, it refers to an invalid address. The website or the link should be updated		link updated
Etienne Lees-Perasso - Bureau Veritas CODDE	108	3.6	Tables	43	The sum of lines or columns are not equal to 100%, due to the CFF that gives credit. It should be explained to avoid confusion	Clarify	comment added
Etienne Lees-Perasso - Bureau Veritas CODDE	109	5.1, 6.1, 6.3, 6.4, 6.5, 6.6	Tables	47, 48, 66, 67, 68, 70, 71	The tables are small. While we can see the content by zooming in, it is not visible when printing the document	Put the table in landscpae layout	The tables have been modified to increase readability. In addition, the tables in parag 6 are now in Excell format, allowing for a copy/paste of the content.
Etienne Lees-Perasso - Bureau Veritas CODDE	110	6.4		67	The guidance v.6.3 indicates the following sentences must be added in this part: *The transport from factory to final client (including consumer transport) shall be modelled within this life cycle stage. The final client is defined as …* [to be filled in]. *In case supply-chain-specific information is available for one or several transport parameters, they may be applied following the Data Needs Matrix.*	Add the sentences	sentences added

ANNEX 4 - Other Annexes

793 Recycling process details

794 **Default activity data for cell recycling /step 1**

Recycling: step 1 pyrometallurgical				
Recycling of the cell and recovery of the metal: shredding, calcination, smelting				
Input				
Active Components				
	Cell	1	kg	
Energy				
	Electricity	0.551	kWh	
Water				
	Tap water (cooling water)	14400	kg	
Auxiliary materials				
	CaO	0.129	kg	
	Steam	6.11	kg	
	Preheated air 400°C	1.042	kg	
Output				
Materials recovered				
	Alloy	0.483	kg	
	Slag	0.252	kg	used for backfilling
	Steam 15 bars	11.76	MJ	heat recovery as utility
Emission to water				
	Cooling water	14400	kg	close loop

795

796

797 **Default activity data for cell recycling / step 2**

Recycling step 2 hydrometallurgical			
Metallic alloy treatment			
Input			
	Alloy	0.483	kg
	water (tap)	22.22	kg
	H2SO4	1.93	kg
	Thermal	6037	kJ

	NaOH		0.562	kg
Output				
Waste				
Emission to water	Waste water		24.16	kg
Materials recovered	Material mix		1.034	kg

798

799 **Default metal recuperation proportion according to Screening study virtual products**

Materials recovered	Formula	CPT Li-ion	ICT Li-ion	ICT Ni-MH	e-mobility Li-ion
Copper	Cu	0.51	0.12	0.00	0.18
Cobalt sulphate	CoSO4	0.18	0.60	0.09	0.15
Nickel sulphate	NiSO4	0.18	0.14	0.75	0.10
Manganese sulphate	Mn SO4	0.17	0.17	0.00	0.60
Iron	Fe	0.00	0.00	0.11	0.00
Rare earth metals	RE	0.00	0.00	0.08	0.00

800

801 **Bill of Material for the reference EPTA charger**

802 When no primary data is available, the following Bill of Materials will be used for the charger, based on the
803 weight of the reference charger indicated in Table 21 for each application, and the data description of table
804 21.

Material/process	PEFCR geographical reference	PEFCR dataset name	Unit= %
Cable	EU-28+EFTA	Cable, three conductors	9%
Plug+ DC/DC	World	steel	70%
Populated printed W board	World	PWB 8-layer	7%
Plastic casing	EU-28+EFTA	PP granulates	14%

805
